If you want small, the PDL-2 is the one that everyone tries to beat.

If you can live with it, the Moonraker 4 or its Maco (shooting star) equivalent is nice.

If you want one that will last a thousand years, get a Joe Gunn... His antennas work very good, and last, and last, and last! The down side is the price.

: I was just wondering if it's possible to rig something up whereby you
: could listen and talk to a second party at the same time. Has anybody
: tried this before? It seems like it might be do-able with two radios,
: sending and receiving on different channels, but with only one radio and
: one antenna, might be harder....

Hi Robert,

It's possible using a few different plans, but what I think you might be heading for is someone to describe a CB repeater. Here we go...

Requires two radios on, one on channel 40 the other on channel 1.

The audio from the channel 40 radio is taken from the speaker jack, placed through a circuit where it's reduced in level and isolated, then presented to the mic input of the channel 1 radio.

the channel 40 radio is your receiver, the channel 1 radio becomes your transmitter.

The Squelch or meter circuit of the 40 channel radio is also sampled and it's output drives a Carrier Operated Relay "cor" circuit which keys the channel 1 microphone anytime it sees a signal above a certain level.
You end up with some kind of fun here because CB is mostly AM operation which is not as friendly to noise as the common fm repeater is. That's the nature of am vs fm.

Operation:
So, you and all the repeater users are driving around with radios that will offset/split it's transmit frequency from the receive frequency.
Like the operation of the common 2 meter radios hams use.

All of you listen to the repeater output on channel 1, any transmissions will have their radio tx on Channel 40, the repeater will hear it and rebroadcast it back for everyone else on channel 1.

Everyone hears channel 1, everyone talks in to the repeater on channel 40.
That's also pretty much how the ham and commercial repeaters work except they most often use FM modulation.

There are some technical issues which need to be dealt with. You would need two seperate antennas for each radio. The average receiver for a cb is pretty bad at rejecting the nearby transmitted signal. You would need to add some filters know by various names into the antenna line.

Even better would be to also add filters into the transmit line.
In the real world you would have to make some serious compromises to get

a system to operate properly.

Enough of the proper filters wired properly may be called a duplexer. Isolation is provided by enough filters placed in the transmit and receive coax lines that the outputs of both tx and rx filters are combined and sent off to one antenna. Remember that your cb repeater transmitting on channel 1 and receiving on channel 40. That term is your frequency seperation of about 410KHz which is pretty close and hard to do right for most people.

There are other situations that work well... I build a lot of repeaters for the Ham Clubs in Northern California and I tune cavities and duplexers all the time. You can email me direct if you have a detailed question. I'm happy to help those that want to learn.

good question

: Is there anyone out there that will wind Baluns for me?

You can probably get Compainies like Mini Circuits and Amidon to sell you made up baluns, but I think I saw you saw that you'll want 100, wow... gonna be pricey...

Go to the Amidoncorp web site and order the balun cores you need for your frequency range. If your not jamming a lot of power through a core, the T-50-2 is probably what you want.

Pick up a copy of the ARRL Handbook from Ebay and the baluns your looking for are shown. Save yourself some money and time plus you can beat a Handbook for an overall reference for radio work.
All the bologna you see posted about impedance and ratios is properly explained in the Handbook with winding information.

3318. Re: SWR Power Loss Chart

Newsgroup: rec.radio.cb
Date: 1999-11-19 00:00:00 UTC
From: tnom@mucks.net
Message-ID: <87o1OPsSlLKY8ogLQVtJhgDlQO3Y@4ax.com>
Source record: 11703

snip
>I downloaded the article and I'm looking it over. M. Walter Maxwell's
>article appears generally quite accurate except where he tries to blame
>transmitter overheating to a coupling problem and not reflected power
>despite the fact that he wouldn't have a coupling problem if it were
>not for the reflected power. He has submitted to the same pitfall that
>many do when a lumped element analysis is performed on a circuit consisting
>of distributed elements.
snip

His account of transmitter overheating is correct. Try this
experiment. Take a 100 watt amp, or any transmitter that
is convenient. Measure the amperage at a 1:1 match.
Then take the same amp and through the use of a tuner
or any or any other method create a 2:1 match. You will see
a doubling of the amperage drawn by the amp. Could this
be the heating effect of a high SWR?

>Let me point out a few of M. Walter Maxwell's
>statements from that article.
>
>1) "Rational and creative thinking toward antenna and feed-line design
>practice has been absent for a long time, having been replaced with an
>unscientific and thought-inhibiting attitude.
>
>Yes, tnom, he's got you pegged.

Could you quote the part where he mentions my name?

I assumed he was referring to you??? After all he asks "Have I fallen
prey to any of the erroneous teachings?" I think that describes your
belief on this subject, not mine. Besides I have not attempted to do
anything scientific or unscientific. I have just been trying to set
you straight.

>2) "...all power reflected from the line/antenna mismatch which reaches the
>input source is conserved, not dissipated, and is returned to the antenna
>by the "antenna tuner" (transmatch) at the line input.
>
>Note that re-reflecting the power *required* an antenna tuner. A 50 ohm
>transmitter without an antenna tuner would have absorbed the reflected
>power
.
You are making quite a jump. Where does he say a tuner is REQUIRED
for re reflection? You better read it again. A tuner is only required
for COMPLETE re reflection. Even without a tuner the transmitter re

reflects most of the reflection. The transmitter does NOT look like a
50 ohm load to the reflection so that it reflects most of the power
back to the antenna.

>3) "All reflected power reaching the source is returned to the load, as
>part of the forward or incident wave."
>
>This sentence best illustrates my point about misinterpreting statements
>out of context. Left alone, this sentence is not true. Maxwell used it
>in the context of describing conditions with a conjugate match.

Then read this stand alone statement.

"Reflected power does not flow back into the transmitter and cause
dissipation and other damage.Damage blamed on reflection is really
caused by improper output coupling adjustment - not by SWR"

>The statement is true with a conjugate match.
>However, if you have reflections on your transmission line, a 50 ohm
>transmitter does *not* provide a conjugate match without retuning (which
>would then make it some impedance other than 50 ohms) or an antenna matcher.
>
>Bottom line: For a 50 ohm transmitter, reflected power does flow into
>the transmitter where it is dissipated as heat. It is an irrefutable fact.

If it is you should write your own book.

It may be easier to just re-read Reflections. You are still assuming
that a reflecting wave will see a perfect 50 ohm load at the
transmitter. Therefore it will be consumed as heat in the finals.
Well, the truth is the reflected wave does not see a perfect
load and hence is mostly re-reflected.

Hello. I am a serious collector and restorer of old vintage CB and shortwave equipment,I have been collecting this type of equipment for 15 years,,since I was a teenager. I am looking for any old SBE catalogs or Lafayette Radio Electronics catalogs. Look around your basement,,,maybe in the attic,,,how bout grandads shed full o junk? If you have any vintage CBs,acc, etc,,,regardless of make or model,please e-mail me with make,,model,,condition(working and physical), and asking price(reasonable please) or trade, etc. I would like to develop a small vintage CB museum somewhere down the road for old radio buffs like myself. I have alot of new and used parts and items for vintage equipment. If you find yourself looking for some gizmo that goes to that old CB set,,dont be afraid to look me up. All e-mails will be answered promptly. Thanks for reading! Hope to hear from ya!
Glenn

Hi, I was wondering if the Galaxy DX-55V had echo in it. I was thinking about getting this radio's for Christmas. If it doesn't have echo, i was thinking about buying a D-104 M6C mic. That would probably be a nice crisp sounding radio.

Thanks Buckaroo "223"

>George Warner

Complete re reflection is obtained by the use of a tuner
Even without the use of a tuner most of the power is still re
reflected.

Read the section where he describes not using a tuner and then
adding a tuner.The power is not dissipated in the finals in either
case.

Part 6.

Reflected Versus "Lost" power

Mr. Jones,

I couldn't have said it better. Your post was absolutely brilliant. It
just is beyond my ability to comprehend, why people *must* attack CW because
they don't like the code test. Where you listening, John? Because someone
likes and uses CW, does not make them a knuckle-dragger.

Perhaps there are no local SSB users in your area. To test your
radio, arrange for a AM friend, with SSB on his radio, to switch to SSB
with you. Maybe when others hear the two of you talking on sideband,
they will join you.

> SWR is 1.2:1 through my 102" whip and AM is working well.
>

> seem to be too much traffic on ssb except for maybe lower 33.

Try the LSB of channel 38 (27.385 MHz). It is the most popular SSB
frequency in the US. In fact, it is customary for U.S. sidebanders to
use channels 35 through 40 (mostly LSB). Older SSB users, who predate
40-channel radios, can still be found using channel 16 (or is it 15??),
again mostly LSB.

My neighbor's radio is ruining my life. I don't want to rag on anyone's hobby. I'm a compusive net nerd myself and don't particularly like people telling what I can and can't do online neither, but I am getting my neighbor's CB clear as a bell and as loud as a large bell, through my stereo and recently even through my cable TV. His 40' antenna is a frisbees throw from my house. Can anyone tell me what this is all about, and what I can do about it while still being a good neighbor? So far I have only heard such suggestions as straight-pinning his coax. I don't consider that a good option.

Did you have anything to do with the repeater that GEARS uses?

They have a kick butt system... I used it for a couple years.

Cecil,

My problem, as I have stated, is when people trash CW (the mode) so they can score points as an NCTA. Because they don't, won't, or can't use the mode, is not a valid reason to denigate it. You have stated on many occasions, that you have nothing against CW (the mode), that's fine. But when, John makes a blanket statement about CW = Knuckle-draggers, when I doubt he has ever actually used the mode; then I find the comment unwarranted. As you know, CW is something that must be experienced in order to gain a valid opinion about it's use or enjoyment value. Simply coming to a conclusion without ever experiencing it, is like saying I hate swimming without ever being in the water (how do ya know?)

My friend...

I am originally from the west coast, and when the sun goes down, so do the conditions...

The islands are far enough away that when conditions are rolling for them, the West Coast is getting an earful of them, just as much as the people in the midwest.

Hey look ASSHOLE. I sure the hell didn't come on here to lie about anything. For your information if you looked at any of the other posts there are ways to hear cb's on your computer. What the hell is your problem man. I came on here looking for help and your just trying to be an asshole. I have better shit to do then come on the computer and make up lies. Frankly I have been looking over this board and would like to thank the people that did try and did help me. I have noticed that allot of people on here like to fight. Damn this is a message board if you want to fight about shit make a fight board. some people have better shit to do. Also to whoever keeps making the coments to me trying to make me look stupid (dont feel like looking up the name right now) I said in my main post that I knew absolutley nothing about this. I am trying to learn and what i have seen from some of the people on here I don't know if getting a cb is worth the money if there are going to be assholes like you on it. Thank you Hank for sticking up for me and helping me out.

Could you possibly clue me in to which bill was enacted into law and who it's sponsor(s) are? I know of many pending, but none that were enacted into law that give specific jurisprudence to local municipalities to enforce federal law. Please be more specific, if a correspondent of mine in DC dropped the ball on this one, I need a new protege if my publicist finds out.

I must be from another planet or something. I can't imagine what
the possible problem is here regarding getting "on frequency" with
the rest of the group.
Having done this since the late 60's, I can assure everyone here
that an unlocked clarifier is the way to go. I mean having the Tx
follow the Rx. Anything other than this will definitely lead to
confusion and wasted time trying to get everyone on freq.
If one of the stations has a tin ear then simply move to that
person and be done with it. Tell that person to not touch his
frequency control.
Somewhere here someone mentioned Ham rigs are best about
frequency accuracy. I can say with some authority that Ham rigs are
not the last word in accuracy. Most of them come out of the box a
few tens of cycles off and as they burn in, they get worse just like
a fresh cb. I say it's not uncommon to need a touch up on the
reference osc. in most new Ham rigs after a few months go by.
And finally, who really cares if when you finally all get
together if you're a few tens or even hundreds of cycles away from
dead nuts on center slot? It's not gonna' matter much at all.
For the nit picker who is gonna' tell me all about ocxo's and
tcxo's in these new rigs, don't bother. Been there, done that. Got
the "T" shirt and the cap.

Finally! Someone has finally gotten to the correct answer. I
tried to say this exact thing but either y'all think I'm a
blithering idiot and won't read my posts or it didn't make it to the
NG.
I am assuming that some of you work in two way and should be

familiar with crowded repeater sites wherein a combiner along with a isolator for each tx is used.
I would also assume those familiar with my example also realize just how easy it is for the output of one tx to find its' way back into another tx final and cause all kinds of intermod. Hence the need for isolators/circulators.
Also, the reflected power can and does destroy a final not just by heat but by overvoltage as well. I qualify this with an example. If anyone here is familiar with two tone or multi-tone testing of an amplifier you will immediately remember the relationship between the power output of a single tone compared to a two or more tone drive. You should remember the 6 db difference between the single tone and two equal (in amplitude) tone output powers. This 6 db higher output occurs when the individual tones are in phase and combine in output. The frequencies do not need to be that close together for this to happen.
Remembering this 6 db factor, when the reflected power makes it's way back into the final stage tuning networks, the phases of these signals will at some point be "in phase" causing the voltage in the tank circuits and ultimately the transistor collector to increase.
The actual increase at the collector and in the network could be more or less and depends on the network and the magnitude of reflected power. However, when the final is already driven near it's limits due to applied modulation voltage peaks and you throw in an additive peak of that same modulated signal from a reflected wave, you can see a considerably higher rf voltage at the collector and higher peak voltages and currents in the network. This could cause the transistor to break down.
Another aspect of this returned in phase voltage is that the design of an output network for a transistor is partially based on the expected peak power the stage is going to put out. When you add more voltage to the collector than the tuned stage was designed for, you change the collector load impedance to something the network wasn't designed to transform. In most cases, raising the collector voltage increases the collector impedance which now forces the output network to present a mismatch to the collector and ultimately allows there to be an even higher voltage on the collector just due to this mismatching.
In any normally working tuned stage for rf, there can be voltages and currents available across certain individual components that may be much higher than the applied dc values. This voltage might cause a breakdown in a cap or maybe arcing across a coil turn. A cap may be already running close to its dissipation limits for current and if that cap has any appreciable loss tangent then any excess currents due to incorrect collector impedance matching or just the presence of reflected power might serve to cause an overdissipation condition through that cap. i.e. heat, sometimes a lot of heat. Coils are typically lossier than caps and can become overheated under these same conditions.

So, whoever said heating of the final was the result of
reflected power, take a bow you are correct.
Whoever said the final can and does act as a load for reflected
power, you are also correct.
I remember seeing a couple more correct assertions here but I
don't feel like going back through all the posts to find them,
sorry.

Here goes.... My first CB was a Globe President 8A which I bought with
allowance money for $15 in 1972. As an 11 year old kid, I had no idea
that using the family TV antenna for my CB would eventually burn the PA
to a crisp. Second radio was a new Lafayette Micro 12, then I got an Eico
771W from Uncle Charlie. I loved it but it had a highly unselective
receiver....I heard everything across a 5 channel range. Then I had a
Lafayette He-20B, Johnson Messenger I, and finally a Sonar FS-23 (great
radio)...then I became a ham in 1975....I still have the Sonar, Johnson,
and both Lafayettes. I would LOVE to have that Globe President 8A !!

Sent via Deja.com http://www.deja.com/
Before you buy.

I have used it up to about 40 ft with omni antennas. I drill a couple of hole through the joints and bolt them together. The stuff I have used was pretty stout. There may be some lighter weight stuff out there I dont know about. Actually if I could find some lighter material I would like to use it for boom materialand upper sections of the mast..

>drift together.

Well, if my radio is at one temperature and drifting a certain amount, and your radio is at another temperature and drifing a different amount, and the Tx/Rx are locked, then if I tune my Rx to your Tx, then you will not hear me correctly, so you'll tune to my Tx, and then I am no longer hearing your correctly because, since your Tx/Rx are locked together, you just also retuned your Tx, which I had previously tuned my Rx to. At this point, neither of us will ever be able to tune each other in and talk also.

Exactly right, but this requires a seperate Tx and Rx tuner, not both
locked together. This way you can first stabilize your Tx given your
particular radio and climate condition. Granted everyone will have to
tuned their Tx to a net controller who is telling everyone that they
are in sync. Then, everyone just tunes their Rx to any one of the
particular radios in the group and it will be correct for the whole
group.

I have three CBs that I want to sell,They are all in working condition they
are as follows
1 Midland 40 CH Model 77-104
Includes Mike
Condition 6
2 Midland 40 Ch Model 77-145
Includes Mike and mounting bracket
Condition 6
3 General Electric 40 Ch Model 3-5806A
Includes Mike ,Bracket,power cord
Condition 6
I will sell all three for $95 shipped to your door

Thankyou & 73

Go to radio shack (sorry for the potty mouth) and get a pack of RF CHOKES and install them on the speaker wires as close to the speaker as you can this should help with the speaker problem . try a high pass filter for the tv , you can get these at different places so shop around. good luck

Tell your neighbor what he is doing. If he is unwilling to help rectify the situation he is technically breaking the law. Ie: If he says to you, "Shaddup ya' f-ing *ssh*le!" If he's causing serious interference, it is quite possible that he is using an illegal amplifier. Then it becomes the business of the FCC. However, if it is the fault of your equipment then there is little you can do. Speaking in gross generalities, lower price consumer electronics are more likely to be interferred with as they lack the shielding of superior equipment. You get what you pay for. I had my station "inspected" a number of years ago because I was wiping out a neighbor's clock radio. Everything checked out okay at my station so the inspector broke the news to my neighbor. Much as I was in the right, it wasn't good PR. But that's okay, I just moved!

Selling to help settle a family estate

There is one tube driven CB, It's made by Johnson, it says "Messenger" on
the front and there is a casting of a Viking, so I presume it's a Viking

Messenger. The model # is 242-128. Chrome front. From what I found out
this is what they called a "White Face"

There is one tube missing, as well as 8 of the 10 crystals. However, if you
can dig up a schematic or tube diagram and let me know what the tubes and
crystals are, I probably have them here (tons of crystals and tubes from

this estate) SALE CANCELLED - UP FOR GRABS AGAIN.

The other CB is a Midland. Model #77-155. Looks like your run of the mill
radio, transistor. No mike attached to it, but it's a four pin
connection.

I also have a very old Marconi/Raytheon Models 1583D and 1585B, two pieces
of a set. This is a mobile radio, tube driven at 6 volts. Freq. 162-172

Mhz. It has some parts missing, Like crystals, but nothing of the
circuitry. 30 watts output. Has a very old hand held mic attached to it.
Looks like something that Andy Griffith would use :-)

email me with your offers or questions

William

Greetings!

tnom, don't forget that the final network to arrive at an unbalanced
impedance, can also accept power and reciprocate this power to provide
a far lower impedance impinging on the load the final delivers into,
to be converted.

As far as I can tell, there is no CB on the market designed to absorb
this energy except for conversion to a lower impedance to be
dissapated by the final.

I see no provision in a typical CB radio to "reject" reflected energy,
unless I'm missing something in the way the output network and the
52MHz trap are designed, these things are two-way pipelines.

As far as I can tell, the working load on the output conversion of the
low impedance of the final to the higher impedance of the network
seems to be the hot spot and where energy is converted to heat
competing with forward [different phase angle] energy at the finals
own impedance against the working load at the other side of the output
network conversion, or the reflected energy be re-converted to a lower
impedance.

Is this what Maxwell is trying to tell us?

I'm open for comment on this, flame if you have to, but it is an
interesting coversation at this point...

While Dancing with the Mouse on 19 Nov 1999 17:14:03 -0600, the Modem
interrupted with an MNI from "tnom@mucks.net", and the MotherBoard

Greetings!

Just what does happen when those "quantum states" of electrons when
they hit such a frigid boundary of 0 Kelvin?

Do they fall onto the floor - or would that pose a problem with the
Weak and Strong forces in those little Gluons.

Or would everything just "Gluon" together until the antenna collapses
from all that weight?

Or would it's "spin" torque itself off the mount?

Greetings!

In brief...

Connect antenna.

Turn the channel to channel 20.

Switch knob to CAL.

Press the PTT, or key up the radios Transmitter.

Adjust SWR CALIBRATE knob until the S/RF needle in the meter meets the small red triangle that says CAL on the face of the meter.

Unkey radio, switch this knob to SWR.

Re-key the radio, don't move the "SWR CALIBRATE" knob, look at the meter and you can read the SWR directly.

Note those 1, 2, 3 SWR numbers, if the needle goes above 2 or 3 on the meter, unkey and don't try to key this radio up for longer that 30 seconds at a time - you're running a high SWR and the antenna needs to be tuned.

To help you figure out where your antenna is best tuned for, switch the channel to 40, and keep the knobs as they are, then check SWR on that channel - still above two or three, note the location of the needle on the face of the meter.

Do the same for channel 1, and let's compare notes...

Channel 1 lower than channel 40 but still above 2 or 3?

Better check that antenna;

move it to another location,
or if you are not sure of the condition of the
antenna, try using another one, better look
at using a newer antenna than that.

Lot's of times, the coax, or the antenna itself, gets
water in it and corrodes, ruining the match.

Check out my page for a reference if you need help figuring out what needs to be done...it'll save bandwidth...

http://www.iserv.net/~codyspc/antenna1.htm

Hope this page helps.

I have convinced a formerly Possessed Satanic friend of mine (relative, actually...my brother) to convert to the ways of the Lord Jesus and sell his Evil, Vicious, Demonic linear amplifier.

I bench tested it myself, works fine. It is a Matcoe 225 Plus with preamp. Hi/Med/Lo power levels, cosmetically a 7 out of 10, I don't know what kind of transistors are in it but I can go over to his house next week and take a look.

Asking price is US$100 including shipping to lower 48 states.

If interested please email at dmcnut@juno.com or if you want you can email me.

Praise the Lord and pass the Moonraker Four!!!

Now, your trying to tell me that you talked to your uncle on his CB by
using your computers sound card mic? Excuse me, I don't care how much
you say it happened, but I know that this is totally impossible and
you must have just thought you heard your uncle saying yes to you.
Bleedover on your computer from a CB is entirely possible and happens
every day.

The reason your getting the responses that you have been getting is
that a lot of people like to come to this newsgroup and post stupid
messages which try to irritate the regulars on this group.

>For your information if you looked at any of the other posts there are ways
>to hear cb's on your computer. What the hell is your problem man. I came on

Yes, I know about all the ways to hear HF on your computer. But you
said one thing that was totally farsicle and that was that you talked
to your uncle using your computer! This is laughable at best.

>here looking for help and your just trying to be an asshole. I have better
>shit to do then come on the computer and make up lies. Frankly I have been

I just recieved a galaxy saturn base and am very confused by operations of this radio after mods.
I have owned a galaxy 2527 and galaxy mobile export radios in the past and they were easy to use when all bands opened up. THis radio seems to either be difficult to use or maybe was modifyed incorretly. It seems the 10k switch is disabled or is giving me 11 meter band when switch is in 10k up posistion and band switch is set to band "d". the problem is that while some channels work and freq counter is correct it seems to skip some channels example I was hearing same channel on channel 27 and 28 and another same conversation on channels 39 and 40, Also I notice some channels are missing example channel 7. They clarifyer cant slide it down all the way when on channel 8. when I try putting 10 k
switch in down posistion it seems that the freq counter doesnt move when changing channels.
very confused.... can someone please help me understand if this radio is right or are saturns not easy to operate like there cousins when modiyed.
thank you very much
Tod Kertz

So the FCC are knuckle-draggers, eh? The administrations of almost every other country issuing HF amateur licenses are knuckle-draggers? I think I have this straight--they and anyone who supports a continued morse testing element for HF access are wrong. You, a person who can't keep his stories straight and who leans toward fabrication, are the enlightened one. Does that about sum it up? I sure wish I could take you seriously.

Source record: 11803

Im trying to decide on a good solid all around antenna for
my GALAXY SATURN basestation.I will be using it for the 11 meter band ,

just the regular CB channels. Two models that I am considering are the
ANTRON 99 and the MACO V-50. I dont need anything fancy , just a very
good working antenna that I can use to talk a pretty good distance from
my base and shoot SKIP on occasion.
Some say that the ANTRON 99 is a good choice , others refer to

it as a spatter stick. Some say the MACO V-50 is a good antenna , others

say it is too flimsy and does not hold up in stormy weather. I plan on
putting the antenna up about 100 ft in my cedar tree , and some people
say that a ground plane is not necessary with an antenna that high.
Would a ground plane be just a waste of money when you have the antenna
that high?
Any info you could share with me would be greatly
appreciated.
You may E-mail me directly if you wish.
Thank you , Edward S.
Puyallup Wa.

A CB repeater would be very difficult, not just because of the small freq
shift, but also because of all the noise and number of people using the
bands. It would become practically useless when skip rolls in because it
would by keyed up so much. You'd need an alligator timer to keep from
overheating the transmitter! If they would make packet legal on CB in the
US, then everyone could have a digipeater, and it would be much easier than
attempting a voice repeater! They are having great success with packet on
CB in Europe, maybe the FCC will consider making it legal someday.

What your mate is talking about, is using an "inverted V"

Don't bother with all this stripping coax, just buy an 18" length of copper earthing cable, it's a lot easier, cut in in half (2 x 9" lengths).
Now cut back about 5cm of insulation from the end of your coax and seperate the inner conductor and outer braid. Now connect the outer braid to one of you nine foot lengths and the inner conductor to the other using terminal block. Attach this whole assembly to the highest point of the roof (find some where away from any obstructions or metal piping) and run the lengths of copper cable along the rafters following the line of the roof to create an inverted V. You will need to then check SWR in the usual way. You will need to cut the ends of the copper cables equally and a bit at a time (careful here as you can't stick bits back on!!) untill the SWR reads the same at your highest & lowest channel, and is lowest in your middle channel.

If set up correctly this will work as well as any other type of loft antenna, and be a great deal cheaper.

If you need any more info, email me and I'll go into more detail or supply a diagram.

Also be aware that these aerials can cause TVI probs due to radiation
from the co-ax, which can cause all sorts or probs.

Ideally you want a balun which is easy to make, but probably outside
your budget if you buy one.

Check your SWR carefully, but a 2:1 SWR would be what i would expect
without a matcher.

If you're really skint you can use commonly available "hook-up" wire
from maplin etc. The thin stuff would be for low power only, but it
would get you on the air for pennies.

Or i can do a new half-wave for ï¿½12+p&p :-)

> follow the Rx.

This is fine if every radio is tuned to a high degree of accuracy. However, if even one radio is out of tune, the entire conversation is in trouble. And there can be a number of reasons that a radio is out of tune (poor tuning in the first place, poor maintenance, temperature drift, etc.)

Lets give a quick example. You and a friend are talking. Both of you are using perfectly tuned radios, so both of you are able to easily tune each other in.

Now another person wants to join the conversation, but his radio is slightly off. The two of you tune your radios to him. But, since your tx frequency changed when you changed your rx frequency to hear him, he now has to retune again.

And, since his tx frequency changed when he changed his rx frequency to hear you, now both of you have to retune again. And then he has to retune. And then you have to retune. This could go on endlessly.

When the tx and rx are not tied together, the tx frequency does not change as you adjust your receive to hear another. Since everybody's tx frequency remains constant (even if not perfect), all that is required is a quick adjustment of the receiver as the different people talk. Once you get the hang of this, this adjustment is rather painless (its easy to remember the knob position for each person).

> If one of the stations has a tin ear then simply move to that
> person and be done with it. Tell that person to not touch his
> frequency control.

But he has to adjust his radio to hear you after you changed your radio to hear him (remember that your tx changed as you adjusted your rx to him). And since his tx and rx are tied together, and his tx changed as he tuned his rx to hear you, you will now have to readjust to hear him. And then he will have to readjust. And here we go again, endlessly.

That is true to some extent, but most ham radios are tuned better at the factory. And they tend to use higher quality components, so there is less shift due to age or temperature. And, on the higher end ham radios, there is circuitry included to monitor and regulate frequency drift, insuring an even higher degree of accuracy.

Okay, you will need to talk with your neighbor about it, since both of you will need to work together to solve the problem.

He will need to insure that his antenna, radio, and any other radio devices, are properly grounded. He will also want to insure that he is using good quality coax and that his antenna is tuned properly (low SWR). After all this, he may also want to consider a bandpass or lowpass filter.

It is also possible that he is using an illegal linear amplifier to boost the power output of his radio. If this is the case, he may need to turn it down or turn it off.

You will need to insure that your cable television system is properly grounded. Look for a copper rod in the ground near your cable service entrance (the box outside your home) and a heavy wire running from the cable service entrance box to the ground rod. If you don't see one, call the cable company (this is required, so there should be no costs involved). After all this, you may want to consider a highpass filter for the back of your tv equipment.

Use the shortest wires possible for your stereo speakers. And don't leave the wires a tangled mess behind the stereo (tie each wire up neatly in a tight bundle). Remember that any wire on the stereo can act like a wire antenna, so eliminate as much wire as possible (or give it a low capture area by tying it in a tight bundle).

All this should solve your problem nicely. By the way, if he refuses to cooperate, you may want to consider a nice letter to the FCC. In fact, just the threat of this may change his mind about cooperation (especially if he is using illegal equipment).

Source record: 11821

Flip the radio upside down with the front panel facing you and remove the bottom cover being careful not to pull on the speaker wire, which you should dis-connect at that point. Near the front panel of the radio you will see a small circuit board that is elevated from the main board and is mounted inverted with its circuit traces facing upward. Remove the soldered tab that is connected to the chassis and serves as a ground, making sure that no solder drips or splats onto the main board below, then remove the phillips screw that holds the board in place and remove the board. Look on the component side of the board for a series of three small holes labled Con1, if the radio has solder filling hole one, remove it, and solder holes two and three together. It is very easy to confuse the holes because of the layout so be careful.

The modification is very easy, and what Eagle basicly did was to remove the three pins that pins two and three were shorted out on with a plastic jumper block as you would see on 2950 etc... and leave three empty holes there that you short out holes two and three with solder.

Thats it...the unmarked top center button is your band select, and you will have 10 bands of 40 channels. The LCR button serves as a -5 or +5 kc up or down adjustment. The other buttons function as marked. Do not crank up your AM power & SSB power!! Leave them as stock because this unit has no heat sinks and runs hot!!! Even with a 1.1 SWR it runs hot, so leave it at 4 watts AM, 12 watts or a little under SSB, or you will burn it up!!!! Leave your modulation limiter in place and crank your modulation pot fully clockwise. Run the microphone gain on maximum if using the stock mic, and hold the mic about 8 inches from your mouth and you will get out loud enough and clean enough that people will find it hard to believe that you do not have a power mic. Alot of features for the money!! So Long.

Thanks all for the suggestions.
I'll try using proper protocol to raise a local.

Yes the RF meter bounces like crazy when I transmit so you are probably correct in that is putting out power.

I had an old cobra-138 twenty years ago. I seem to remember that the clarifyer adusted both tx and rx. Maybe I'm remembering this wrong.

I'm not trying to work a lot of distant states with my mobile (yet), I'll just have to scare up a local ssb.

Sounds like someone did a great job 'modifying' your radio. Next time,
consider the possibility that it might be a good idea to leave well
enough alone and just talk on it.

Greetings!

Ceramic have higher tonal response, but a greater volume of output.

Dynamic are bacially little 600 ohm speakers, like a tweeter in a speaker cabinet. Have the better fidelity of all those listed. Low output and are impedance termination sensitive, the output on the element and the input of the amplifier, need to be equal for best transfer of energy.

Electret are powered by a small voltage, and have a frequnecy response and volume of output similar to the tonal response of Ceramic.

Crystal has a sharp tonal range, and has an output voltage similar to Ceramic. Very narrow frequency response.

Controlled magnetics, AFAIK, are dual coil construction over a stationary magnet, with one coil that can be used as a NFB to affect the field of the other.

It's not just the element, but the case design housing it, that also determines how the element responds to audio.

A lot of Mikes on radios today, are Unidirectional - or pick the audio the best from one direction only. Most qualify as noise-cancelling.

Dynamics are more Omni-directional, but are put inside a case that is designed to deliver the best response and output, head-on, directly to the sound source.

My own pereference is the Dynamic types, due to the Fidelity.

While Dancing with the Mouse on Sat, 20 Nov 1999 01:09:31 -0500 (EST), the Modem interrupted with an MNI from "thumper485@webtv.net (Chris)", and the MotherBoard buffered this to Video RAM:

Greetings!

Thats up to you.

People can retailiate.

This is whats so sad about the situation.

Personal and private property, under seige - the offender is going to win in court as being the "victim" due to a blathering of words. Even if he's drunk and being a public nusiance on the airwaves, but done at home.

More subtle ways are;
... to announce the address ...
... jamming with low-power RFI generators ...
... parking mobiles in the neighborhood, and constantly communicate back and forth while the offender rambles, usually on an adjacent channel, or even on SSB so others can hear the wisecracks being made on SSB, as heard thru the carrier the other jammer is throwing out...

The more damaging ones are physical in nature, and can wind you up in court...

Yanking off the antenna, or the coax, from the mast.

The physical measures are drastic, and should be avoided. Like the person doing all the interference in the first place, just ignore them.

If the offender follows you around on the channels, and makes verbal threats, you have more to stand on. Recordings played for others to hear can establish the premise of what is yet to come.

Just remember that recordings can also fall back on you, you lower your conversation level to the offenders level, you're just as guilty of promoting the retaliation and offensive behaviour.

But, physical confrontation on the doorstep, or anything done to his property, even phone calls - considered harassment, and you're in the wrong.

The keyword, is embarassment.
Not harassment.

Radio shack used a "different" supplier for the processor chip & specified that there would be no mods possible, unlike the similar Magnum 257, superstar 4900+ ect, which have the "mod-able" chip. Don't buy the HTx-10 version of that radio for out of band use, it won't work.

3450. Question for CB experts

Newsgroup: rec.radio.cb

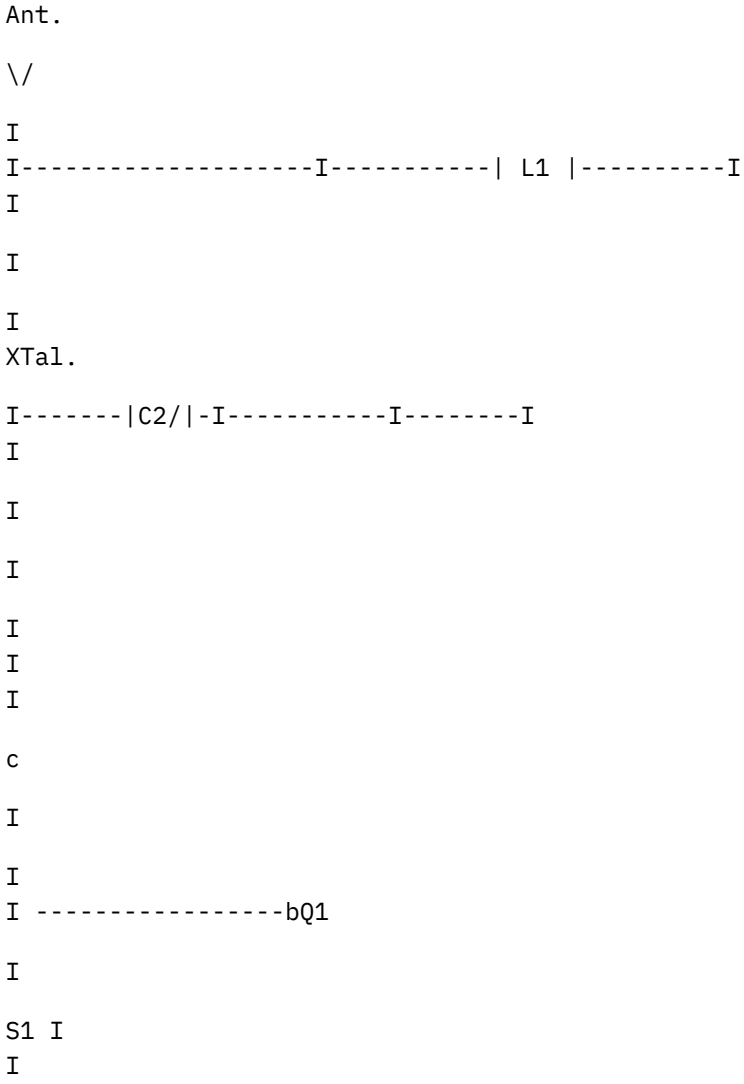
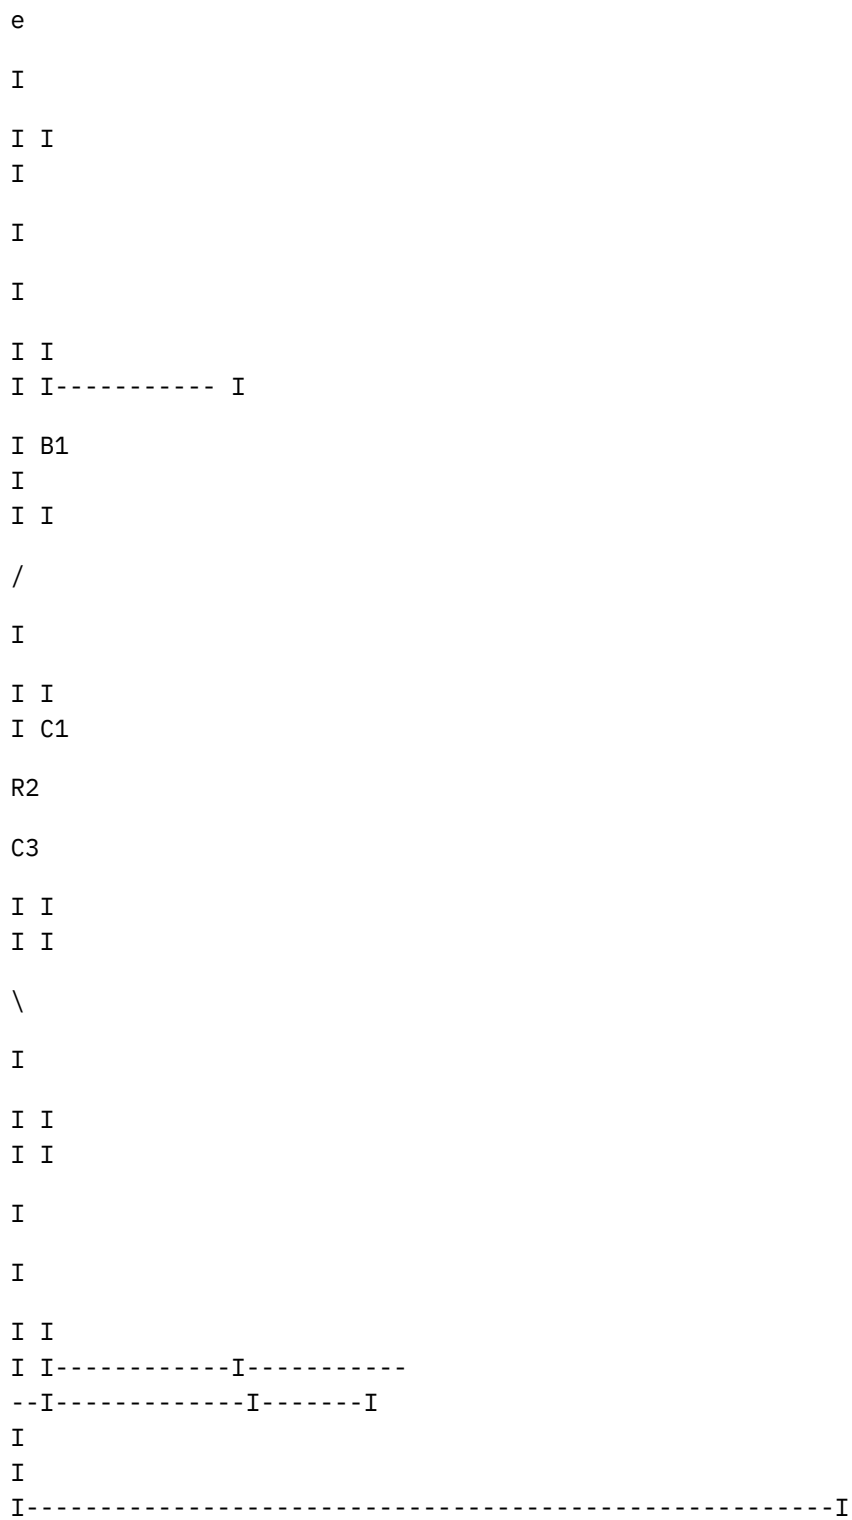
Hi everyone,

I need some help. My question may sound stupid for radio users, but I hope you will answer the following question. I have found the circuit of a device capable sending on the american walky talky band (49.8XX Mhz). That's pretty cool, but since I live in switzerland, have some problems in finding such an american walky talky and don't want to send on maybe "prohibited" freqs, I asked myself how I could change the circuit in order to send on the 27 Mhz CB band. Now my question is the following: is it possible, what changes should I do or is there somewhere a circuit in the internet that sends a signal on the 27 Mhz band?

The circuit is the following:





Q1 = 2N222 transistor
C1 = .001 MFD, 50 Volt disc capacitor
C3 = C1
C2 = 90 pf trimmer capacitor
R1 = 10k ohm, 1/2 Watt
R2 = 470 ohm, 1/2 Watt
R3 = 47k ohm, 1/2 Watt

L1 = 2.7 MH mini choke
S1 = SPST mini switch
XTal = A XTal in the 49 MHz Band
(The circuit is in Helvetica 12)

Thank you very mutch in any case.

3459. Re: SWR Power Loss Chart

Newsgroup: rec.radio.cb
Date: 1999-11-20 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <3836ab67.3569257@news.iserv.net>
Source record: 11844

Greetings!

Bob, first, thanks for taking the time to recognize the a CB radio with all it's inherent faults, can have a major impact on how people perceive SWR as being a "bad thing to have when it's high".

This is true for a lot of the CB radios on the market today, they reciprocate the arriving reflected power back to another impedance that is far different than the unbalanced output network can handle once it's arrived to the radios final section.

This power can be disspated in a myriad of ways, and combinations of such...voltage thru resistance, conversion of high voltage to higher current, and higher current thru passage into a resistance.

Conversion of the relfected power to the lower impedance thru the tank circuit is one of the many banes that cause finals to fail.

Due to the bandwidth of response on the tank circuit, the output of the final can have both forward and reflected power summing into the tank circuit and you have circulating currents and voltages, if not tamed, can literally blow up a final.

Another thread brought up a good point of unsing Zeners to prevent avalance voltages from exceeding the maximum ratings on the final.

Another is what you've stated, and that is the conversion of the reflected voltage exceeding the maximum ratings the finals junctions can withstand.

One of the interesting notes to pass along, is how this can be prevented by simply redesigning the amplifer stage to common collector or base versus emitter. Designing the impedance network is then an easier chore. In a CB radio final section, attributes of all three are combined.

If you take a look at the finals of many CB radios, they use a common base impedance thru the use of an R value with the collector seeing the load on both the audio and applied RF being passed thru a LCR network to the base as an input. The load is passed from the collector to the tank circuit and PI network, and into the load.

[We're speaking of the base region here.]

However the base is also referenced to ground for bias, but little voltage is applied and only for the class of operation of AB in some cases, but in Class C it's run in the cutoff region when no signal is applied - and they are biased so that the impedance network when

reflected RF is high, the bandwidth at the input of the base is also high so as to help disapate energy before it goes to the driver. Due to the characteristic of the collector to base region - when base potential rises, the collector voltage begins to fall as power is allowed to arrive to the base region and with the bias resistor present versus the LRC network from the prior stage, this then sets a reference in which collector voltage follows the base regions own reference voltage set by R. The potential across these regions can be used to obtain gain, by using an LC bandpass.

But, bandwidth is used instead, to provide some "cushion" and isolation of power away from the base and into the emitter and prevent excessive power potenitals from rising above a reversed biased emitter to base situation. Hence, the fudgy "R" values.

Looking at the bias and LCR networks of the Final section, I see combinations of the various other configurations to help the transistor remain stable.

One thing I do notice, and helps with bandwidth, is the application of "fudgy" R values from Base to Ground - shared by the Emitter, part of the bias, yes, but also plays a role in the overall bandwidth of the amplifer stage.

Why do I bring this up?

Well, it's a good question <chuckle> but the design intent of these configurations seen in CB radios are to provide stability when the output network is no longer seeing a resistive load, and to provide a bandwidth in which the transistor can dissapate reactive loads by a referenced R value to ground present at the base and continue operating into the emitter.

Voltage and current rises at all points of the junctions, but the overall potential power differences remain stable for a wider range of energy levels thanks to R and the tank circuits ability to act as a step-down transformer and only provide higher currents which are less demanding than higher voltages.

I guess the key word here is, how an output circuit can fail is determined by the expected bandwidth that the device will be placed in. So, power is sacrificed to gain bandwidth to handle reflected power that cannot be terminated into a resistive element before entry into the tank circuit.

Something that Maxwell didn't touch on...which really plays an important role in how excessive VSWR and loading of the expected R+/-jX into the antenna system, can damage finals. Reflected power is reciprocal, and if the bandwidth of the amplifer stage is not wide enough, a VSWR of as low as 3:1 can cause damage. Simply due to what is described above.

As a secondary note, this also proves the summation problem. Then the +/-jX operator is reduced, the R value is paramount and plays an important role in dealing with dissapative effects the working R on the antenna system provides against reflective power effects on the tank circuit.

One thing he promotes, is a transmatch. Something a CB'er never will need if the antenna can provide for the proper R value [50 ohms] and has greater efficiency even though power level increase is small. The radio works into R, not into losses incurred by the +/-jX thru R.

Sure, you can use antennas that have R-values of 150 and above, but remember the use of the transmatch. Along with the overall size of the more popular CB antennas, they provide low R with higher +/-jX to arrive to a congulate match. So poor VSWR in these types of antennas can arrive to the damaging 3:1 VSWR that many radios can fail loading into.

While Dancing with the Mouse on Fri, 19 Nov 1999 23:52:21 -0800, the Modem interrupted with an MNI from ""Bob C." <bob@bigbird.reno.nv.us>", and the MotherBoard buffered this to Video RAM:

Huh, I always thought skip was the radio wave bouncing through the upper Ionisphere, and then
finding a less dense pocket of O3, and the signal falls back to earth. But, I guess I was wrong.

Well it could be a couple of things one a bad relay, and the options are take the relay out and
see the what the Company name of the relay is and seeing if they are still in business, and make a
call to them. Or find out if there is a cross reference for that relay. O r it could possibly be
the cricuit that drives the coil for that relay. I would look at the supporting circiutry for that
relay. Or let a Licenesed tech look at it first.

A CB repeater isn't hard to put together. All you need is to
split site the system. We're only talking a block or two and a phone
line. You might even use a radio link like a 900 mhz cordless phone
instead of the phone line.
It might take a bit of ingenuity but can easily be done.

In addition to what has been said the high impedance types (ceramic, crystal or stepped up dynamics) will have a tendency to sound higher pitched in a low impedance radio. A typical CB is 600 ohms and as far as these microphones go is low impedance.

Just the opposite happens when you try to hook a low impedance microphone (dynamic) to a high impedance radio. Some Ham radios (real ham radios) are high impedance. The result can be a muddy low pitched sound.

The best overall choice as far as i'm concerned is a condenser mic You get a low priced, high fidelity, mid impedance microphone that should work good on anything.

Propane makes a great refrigerant. It is one of the only substances
that could be used in R-12 systems for replacement. The DOT won't
allow this. They don't like flammable stuff in your AC system.
Why don't they just ban gasoline? (I know, wrong NG!)

hey toll, i ran both (still with the jogunn 5+5 star) and with comparable field elevation and lack of obstructions the pdl and the jogunn are very similar. the difference i find is the jogunn has the better rejection on the sides. of course there is a better forward gain with the jogunn but when conditions are moving its not that big a deal. the jogunns are built extremely well (they stand up to the salt air surrounding this island)
and the pdlII's problem is that damn copper wire that has to be just right.

73, jim, eastern long island ny

This has been covered in posts here in the past week. You did not mention where or how the antenna is attached. My guess is that a coiled metal antenna is no different in impedance than a 1/4 wave whip (36 ohms) and the same things apply here. Make sure that your ground is good at the mount. If you have it mounted on the trunk, ground the trunk lid to the rest of the car. If you are using a magnet mount, ground the base of the antenna to the rest of the car. See if any of your friends has a KW-7 FireStik or maybe even a Skipshooter. Screw it on and see if the situation changes.

(then again, I'm a PC expert, CB is a hobby (more like entertainment!))

(Turn off your damn caps lock or do you scream at people?)

The open coils near the antenna connector form part of the radio's
LOW PASS FILTER. Do not mess with these coils. Your watt meter may show
more wattage, but it is coming out at 54 MHz. Since your antenna is not
tuned for this frequency, your SWR will rise, your final will run harder,
and it will burn up.

You need to specify which radio you are attempting to modify before
asking this type of question. You may want to look at:
http://www.bayshorenetwork.com/
and see if they have what you need.

You illegally mod the radio. Take the normal TX static frequency and
tie it to the normal movable RX frequency control. Then make an
adjustment to align them together. If everything is done correctly
you will never have a reason to ask anybody for alignment advise
again.

OK,its not OK to commercialy manufacture CB amps or 10 meter amps
easily modifiable for or intended for the CB band so WHY would it be OK
to use one?The amp in question is an ilegal CB amp is it not?

3509. Re: RCI-2950 VRS PRESIDENT HR2510

Source record: 11894

Q'nQ (Quirkiness and Quality-wise) they are like apples and oranges, can't compare 'em and the 2510 wins hands down. The 2950 seems to get it's front-end overloaded easier, and tends to show off it's quirks more in mobile use than base station, but as far as display's go (especially mobile) it's the best I've ever seen, whereas the 2510's display (once again, for mobile use) is difficult to read during daylight hours.

Some people are in this hobby to have a sense of accomplishment when fixing something that isn't working when they buy it.

When you get a radio for 50 bucks, working worth 200 bucks, and you fix it for another 20 bucks, it is kind of nice.

On the other hand, their sure are a lot of appliance operators on 11 meters, just like on the amateur bands...

Those are the people who no matter what will listen to what someone tells them will work, when 100 other people tell them it won't.

You figure it out.

The Turner mics also have the compressor in them...

Somewhat of a prerequisite for FM use.

Adrian,

This shouldn't be too difficult to figure out. I used to have a TRC457 which is pretty much the same as the USA Washington. In fact it is damn near identical. I would first get the schematic of each. I can supply you with the USA version but I don't have the Aussie one. Compare the two, but check anyway. Going from memory, there are two cables from the channel selector. One goes to the PLL IC (uPD858c) and the other goes to the display. The PLL IC pins that are used are 13,14,15,16,17,18,19,20,21.This radio uses BCD, not binary, so you need more pins. Interestingly enough, pin 22 is pulled to ground in this radio. Fancy that! I wonder what would happen if you pulled it up to 4.68V? :->

Getting back to the Washington. The divider pins are attached to the channel selector's inputs known as 1,2,3,4,5,6,7,8. So chsel 1 goes to 13 and chsel 2 goes to 14 etc up to chsel 8 gong to 21. Got it? Good. In the Aussie version you might find that one or more of the higher order pins are pulled permanently to ground. This you will obviously have to rectify. Each PLL divider line must have a capacitor and resistor from it to ground. If it doesn, it won't work properly. The supply to the channel selector goes into chsel 9. This should register about 4.68V all the time. It is the supply that pulls the PLL pins up. The resistors I talked about pull them back down - very important. There is an additional line on the chsel, 13, that goes to 4.68V when the selector is between channels. Chsel 11&12 are tied to ground. If i had to guess, I would say that one is the ground for the PLL divider pins and the other is the ground for the LED display. There are 14 lines that attach to the LED display. The LED display has one line that goes to the + supply. So, the channel selector just grounds out the "bars" in the display that should be lighted. The + supply will vary in voltage depending upon where the dimmer control is set to. Expect about 2V for full brightness. This is all from memory so my apologies if I missed something.

Let me know if you need the schematic for the USA version.

Could I replace the RF final with a beefier transistor like 2SC1969 or
2SC2094 and add an external heatsink? I assume the Sidewinder uses a TO-220
packaged RF final.

This depends on who you ask. My personal favorite are the Shure Bros Controlled Magnetic Microphones. The 444D is a good example. These are un-powered microphones but tend to offer high-output and nice tone.

I'm not a big fan of crystal or cermic style microphones. Their days of glory are long gone and you won't find them used in any serious application.

Condensor electret style microphones offer good performance and they are dirt, dirt cheap to manufacture. Some are excellent quality, but most are not.

Hi Chris, I dont know right now still trying to figure what to do. I really like the appearance of radio. You can tell it has been taken care of . Dont know what the problem is . It may be the PLL or something to do with the 10 kc switch. DO you
know how the mod is done in this radio? Do you have to use the 10 k switch when modifying this radio. it almost seems where the problem lies. I noticed when switching the 10kc switch to Normal It gives me like 3 bands but it only switches freq about every 4 channels switched on dial...
If it was something easy but I dont know maybe I could fix.
thanks. decieding what to do..

Not that i am aware of...but if you key the microphone up, or even press one of the channel change buttons or one of the front panel buttons while turning the unit on you will be on 11 meters band on channel 9 FM. Use the mode button to effect this change as you power up and you will be on same band & channel, but AM.

There is a group of them, three or four, who make a game out of
harassing truckers in this area by powering up and walking on
them, playing their noise toys, jamming, and verbally harassing
them. The truckers would like to know where they live. I think
just keeping track of their addresses and giviing them to anyone
who asks for them is enough. But we could also get photos, post
them on a web page along with the addresses, drop by the local
truck stop, and post a few flyers. Other than that, I'll just ignore
them.

>Is this what Maxwell is trying to tell us?
>
>I'm open for comment on this, flame if you have to, but it is an
>interesting coversation at this point...

If I sometimes sound like i'm flaming, i'm not. I'm just being overly
sarcastic at times.

I'm not positive on exactly what Maxwell is saying. I'll have to
re-read Reflections many times before it all sinks in. If you did
read Reflections at http://www.arrl.org/tis/info/pdf/Reflect.pdf
then pay attention to page 44 and especially 45. He discusses
reflected power without the use of a transmatch.

The above section needs to be simplified like the example below.
Assume a 3:1 match with a 100 watt transmitter:

Put yourself in the place of the reflected 25 watts. You have just
gotten kicked out of your home and would love to find a 50 ohm
apartment. You come upon transmitter that bombards you with100 watts.
Hardly a static 50 ohm termination. You high tail your ass out of
there and ask for permission to come back home.

I'll keep on using this one until i find a better one.

No no no no no You are putting way to much importance on the exact
frequency you are operating on. As The Rock would say "It doesn't
matter".

>Granted everyone will have to
>tuned their Tx to a net controller who is telling everyone that they
>are in sync.

This in an unnecessary step, (how's that?), (is that any better?) if
TX and RX are tied and movable. If they were tied and movable you
would never have to ask anybody anything. You would only slide your
receive
into place and because of the tied TX it would be in place also.

>Then, everyone just tunes their Rx to any one of the
>particular radios in the group and it will be correct for the whole

>locked together, you just also retuned your Tx, which I had previously
>tuned my Rx to. At this point, neither of us will ever be able to
>tune each other in and talk also.

horizontal is frequency
****
My radio: RX
TX

My #1 contact RX
TX

My #2 contact RX
TX
****
To correct this mis alignment two operators
simply tune their receivers in and that's it.
****
Step one
RX
TX

RX
TX

RX
TX
****
Step two:

RX
TX

RX
TX

RX
TX
****
****
****

Your radio RX
TX

Your #1 contact RX
TX

Your #2 contact RX
TX
****
How do we correct this? How many steps?
Let's see.....At the bare minimum five.
Doing it in five steps would take an event
like winning the lottery. In the real world it
would take at least eight or ten or even more
steps. It would be a waste of bandwidth to
show it graphically here just as it would be a waste
on the air putting up with operators that can't understand
how to run a radio, If that makes me an asshole
then so be it, but I have better things to do with my time
than tell someone they are on frequency.
****
Please don't think i'm trying to flame. It's just that
it seems so common sense to me. I can't understand
why the untied scenario would ever be beneficial
in your normal everyday roundtable.

I've worked in computer stores for a long time, and have heard this question more than once:

"The program says 'push any key to continue', and I can't find the 'any' key."

You must live in a cave, Jack. BTW, Did you figure out how to put an upper sideband AND a lower sideband in the same place?

1. What a dealer can buy something new wholesale shouldn't be a factor in a retail sale of a used or new product. What we as dealers can get something for (IMO) doesn't need to be shoved down someone's throat when they're trying to sell something. I find it more polite to just not reply, unless their asking price is unusually higher than fair market value.
2. The Matco (e) was made and sold in the mid to latter 80's, and was nearly identical to the TNT. A fair product, and at $100 used and in good shape, a fair price.
3. Not a dig at you personally Dave, just surprised to see that from you.

>From: "Þ®özå©625™"
>Used radio dealers are also like assholes all you get out of them are shit.

You know something fella, since you've come here, you've offered nothing but discontent and patronizing.
Carl is a very intelligent person, and a manufacturer of many innovative designs.
If you were old enough or had the experience, you would know that the items he's choosing to sell are worth well over his asking price.
A friendly suggestion to you is: if you don't have something nice to say, then don't say anything, if you are somewhat uninformed on something, don't make determined statements.
I'm sure you probably don't mean to, but you sure aren't gaining any alliances here the way you have been presenting yourself.
Then again, maybe the things you say are intentional, and if so, sorry I wasted the bandwidth and my time trying to change the "me" generation.

i had 2 antrons myself at diferent times and had been pleased with both of
them.

THE WAY THE THEROY GOES.

if you could "see" the signal radiating from an antenna like the A-99, it would
look something like a big beach ball with the antenna sticking through the
middle of it.
this is somewhat good for skip in some ways as the signal from the top of the
"beach ball" is heading for the sky and, if conditions are right, will bounce
off from the ionosphere to come down somewhere else.
if you add the skip kit, it will pull the shape of that beach ball down to
something that resembles a doughnut.
this more or less concentrates the power of your signal by squeezing it into a
smaller area and sending out toward the horizon at a somewhat higher ERP,

(effective radiated power). like putting your thumb over the end of a garden hose. you're not getting any more water from the water company, just pushing the same amount through a smaller space while getting more pressure.
on average over flat terrain, the horizon is 12 miles before the curvature of the earth takes things on the surface out of the line of sight. this is why broadcast antenas are so high. i don't suggest this but if you were to climb to the top of one of these towers with a pair of binoculars and you'll see farther than 12 miles. this is why they have a greater than 12 mile line of sight range than your average push up pole.
also, at 100 kw to 1 megawatt, you'll get a nice tan from the inside out. :(
with this "doughnut" and higher ERP shooting straight out of the middle of your antenna toward the horizon, when it passes the 12 mile limit, some of your signal will follow the curvature of the earth, (ground wave), but more of it will pass to the ionosphere, (skywave), past the horizon and bounce off and land somewhere at a higher signal strength.
there are MANY variables when one speaks of skip like final polarization when the signal make land fall, (horizontal like a tv antenna or vertical like an antron), and which direction that it goes. this depends on season, the time of day, (position of the sun in the sky), and the 11 year solar sun spot cycle. the higher incidence of sun spots, the better for skip. regardless of wether you use a horizontal or vertical antenna and contrary to what some may believe, when talking skip, you have no control over the final polarity of your signal when it hits the ground as it can change several times in transit. a flat dipole beam is horizontally polarized and it's signal will pretty much stay that way regarding a ground wave contact. when it hits the ionosphere, it may be subject to "ducting" which, again, if you could "see" it, it will look, simply speaking, like it's bouncing around inside an air conditioning duct. this can change the signal as to wether it's sine wave is moving up and down or from side to side.
ON AVERAGE, the skip distance is about 2500 miles from transmitting antenna to receiving antenna on a single bounce.
if the ionosphere and earth cooperate, there are often multiple skips where the signal will bounce from earth to sky back to earth and back to sky several times hence 5,000 or 10,000 mile contacts.
mind you, i've yet to "see" a radio signal but this is the way the theory goes. :)

BEFORE i get blasted by the RF police, (if they read this far before they start shooting),these are very simplistic terms that are ment to bring a mental picture of what's happening to a radio signal as it goes from point A to point B after it passes through customs. this doesn't have, nor does it need, all of the technical why's and where for's for the purposes of this discussion.

i hope this helps.
jeff

with all of the changes that you'll be making to convert it to 27 mhz, you'll
be changing almost every major part in the radio.
unless you're a die hard hobbyest with a lot of time on your hands, it isn't
worth the trouble.
good luck
jeff

check to see if ic 6 or 7 have pins bridged.

thanks I checked and they are not. What I did notice is that there is a light green wire that looks like it was cut from where it enters board saying am-tx-sw and jumped to pot vr-803. also looks like from solder spot that there was a wire either stock or jumped to right below vr803 marked am that there is no longer a wire there.
any ideas
thanks
Tod Kertz

you CAN convert a car audio amp to supply more RF power for your cb and i'll tell you how:

1) gut the audio amp and toss the circuit board.

2) find a linear amp that has a similarally sized and shaped board.

3) install said board into the heat sinked case of the audio amp paying special attention to good heat sink, grounding and ventelation practices.

4) install all of the proper antenna plugs and provisions for power and make all associated connections from said plugs to the proper places on the board.

5) VIOLA!!! 1 cb amp that resembles a car audio amp.

i guess my pain medication is getting to me. :)
have a good day.

These pages descibe "conjugate coupling" (found in very first sentence)
which is equivalent to using a transmatch. He is retuning the transmitter
output circuitry to perform the function normally done in a transmatch.

For conjugate coupling, the impedance seen looking into the transmitter
(or transmitter/transmatch combination) must be the complex conjugate
(R+jX versus R-jX) of the impedance seen looking into the input of the
feedline.

An easy solution which l have done before is use a general receiver with a set of headphones . One person transmits on say channel 4 and receives on his other radio channel 25 .the other person transmits on channel 25 and receives on channel 4 . This works out soo cool and nobody knows what is going on . The neat thing is you both can keep transmitting at the same time , like talking on the phone ! Split frequency and drive your friends crazy !!!!

3604. WTB Junk Cobra 2000GTL's

If anyone has any junk, damaged, parts missing Cobra 2000GTL base radios for sale I may be interested in them for parts. No certain part needed. I do not need speakers or mics. I just thought someone might have one that has been hit by lightening, in a fire or run over by a Mac Truck ect. It can be a unit that was used for a parts to begin with as well. (some parts missing is fine) If you have any that fit this description drop me an email and we can discuss turning your junk into cash. Did you find one at the bottom of a lake?? Does your dog chew on one for a toy in the back yard? E-mail me and we can talk. I am not looking for any working units unless you want to let them go real cheap. If I buy any working ones, they won't be for long!

I see Carl is selling one but it looks like he wants to sell all items at one price. I don't want the other things he has but they would be nice for someone! If someone buys his stuff and doesn't want the 2000 drop me a line!

Thanks!
Mike

I have many times, while on the phone with Becky, offered to do the site for them but there was no interest. I know Sam paid some asshole way too much money for what he had done the first time around and the friggin e-mail links didn't even work! Sam needs to get his act together on the net or it will VERY quickly pass him by. I know Charlie had a site on Angelfire (I think it was Angelfire) last year but without his own domain, who is going to remember the Angelfire/blah_blah URL? If the wholesalers get their collective acts together it would make for much easier price checking. Not sure myself as to Lesco having a site but it would be in their best interest to get one up and running also if not already done.

> HI EVERONE, HOW WOULD YOU COMPARE THESE 2 RADIOS

I've had both in the past. Both are fine radios, but I guess one has to choose one over the other. So...

The 2510 is a sweet little radio, especially with the chipswitch added. The controls are well laid out, but a little small. And the output quality is excellent (especially with a good microphone). I also like the overall appearance. The 2510 is a good radio to use in the house.

The 2950 has some features that are interesting, but seems poorly made (I had minor solder connection problems with two out of two radios). The display is nice. I didn't like the knob layout, but the knobs are bigger with wider spaces in between. Considering the display and larger knobs, the 2950 is a better radio to use in a vehicle.

However, if I had to pick only one, I would get the 2510.

Most people just pick a few numbers that sound good to them. Some use
a variation of an old FCC callsign. Some use the first three digits of
their zip code, or the phone area code in their area. And some groups
issue callsigns to their members.

None of these callsigns are official, or regulated, in any way. And I
don't know of anybody who tracks them on a widespread basis.

Yes,

I was in Lancaster for my Jr. High years...

Like the big building they built for the Space Shuttle on your little base?

My grandfather was one of the first people to ever set foot in that building.

He was also on the U-2 and SR project. Worked at Lockheed in the large complex in Palmdale.

I have a live flight jacket from the SR-71 from the 70s....

Mach ???+ and higher!

We lost windows at Park View Middle School at least once a month.

Typical response....

"Umm, I don't understand the question, and I am sure that deep down inside, I am wrong, so I guess that I will just use some profanity and counteract my $60K education"

"And then, since I sometimes forget what I have said, and am tired of looking like a liar, I will always tell everyone what I said 'Prozac said that'... Yep, then I will be able to go back and read what I have already said and people won't be able to contradict me because I contradict myself"

haha

The easiest way to work one of those it to do one of two things:

1. Use a MB8719 chassis to work as the RX section. Then, all you have to do is put a simple relay in the Johnson and use a diode switch circuit in the 89719 chassis radio on the MB3756 to turn off the RX voltages when keying the Johnson.

2. Do what a lot of the bigstrappers do (including Prime Minister)... Disable the VFO, run a CB radio into the VFO input and viola... You have the stability of the CB radios PLL along with the plate modulated sound of the Viking!

> All it takes is someone with a few bucks and they can have one. he has
made
> several fet amps. Offering them for sale to the cb community would be
> useless.

Why?

Because you don't understand them?

For starters cost is a major factor

Oh BS. Cost of some FETs useable on CB is cheaper than the equivelant assortment of 2879s needed for that power level, you don't need to match FET devices like you have to with bipolars and FETs can be paralleled for more output!

Yep, they shouldn't be used!

and they are not allowed in the
> keydowns

Not totally true. 28 volt and higher devices are not allowed in any class BUT the sky classes, and they get beat, too! However, a 12 volt FET is completely legal!

If you tried to get into a sky class with them people would cry and
> complain that they are not allowed.

If you tried to get into a SKY class, where the only rule is that their isn't any rules people would cry foul? On what basis...

"Umm.. Excuse me.. I just shoved my foot square up in my oral orifice again... Please forgive me while I pull it out.... Prozac said that!"

Windows 98 is looking pretty good for y2k. But I agree you have to get the updates from microsoft site. There is a second win98 cd out (incase you didnt know) that is for y2k. You can get most of what is on the second cd on the microsoft site for the y2k updates. But not all of them. I dont think you have to worry thou. Only people that will be affected by y2k are the little companies that dont think they have to update there software and hardware to be y2k compliant. I get a kick out of these people stocking up on food among other things. They think its the end of the world.

Hey John,

Picture this scenario:

1. You know absolutely nothing about electronics, HF theory, computers, etc.
2. At best you only know how to shut down windows, and start/close programs.
3. Your uncle has a CB that bleeds over, and has some means of finding out what you are saying, or is just messing with you.

In other words, perhaps giving a person one opportunity to tell you what they HONESTLY believe based on the above circumstances isn't really that bad of a thing. Thing is, when you DONT give that opportunity, then all of those that ARE serious about the hobby dont wish to post, and therefore learn, and get this, therefore you'll find yourself with a dying hobby. I believe there are ENOUGH of people out there that would like to see CB die. Oh well. I could go on and on and on and on. I could even ask a rhetorical question or two such as asking whether or not you were born with a CB microphone in your hand. But, why? As I said, it would be a rhetorical question and therefore sarcastic. Blah, blah, blah.....

Hank

Hey Spiker,

If you are considering getting into the CB World, this bulletin board is just an initiation, and the real CB World will be worse at times. It can be rewarding too. If you can cope with the idiots of the world, you will enjoy CB, if not, do not waste your money. You will find the idiots in any field or hobby. With a medium like CB, you will be exposed to many people at once, and maybe several of them will be dips. Take them with a grain of salt, and you will enjoy it. It is not always like this.

Amen. Excellant advice. Sooner or later something always seems to happen to them to stop them. It works real well, but for the most part, the best method is to ignore. They do it for attention, and if everyone, with no exception, just treated them like they had no effect, they soon go away.

Once he is located, you can enforce with the local police. Search the FCC code for the statue on local enforcement, and with enough push from you, you can get results.

Actually if this device is the one I am thinking of, it measures the signal
strength at each antenna, and deciphers which antenna is receiving the
strongest. As long as the signal is stronger on the front antenna, the green
LED is lit. If not, the red LED is lit. Works really well.

I tried this one, only modifed for CB, built by a guy known as Swamp Fox in Salt Lake. It requires that you use two mag mount antennas, that are identical, one on the hood and one on the trunk. They must be at least 9ft apart. Works real well.

If this is a loop, with coax attached to it, it works real well. It really short cuts the search, and mounts on the edge of a rolled down window. It only requires one person to run the show. They used to be commonplace, but should not cost more than $30.

Just use your CB. Mount a magnetic antenna to the center of the roof. Keep turning down the RF gain until you are real close, then unhook the coax if the power is too great. I can find any base in little time. With the antenna in the middle of the roof, you can tell when you are perpendicular to the signal when you hit the point of null. It will be a small, sudden drop in the signal just as you pass it. The signal will either be to the right or to the left. If you turn left, and the signal starts falling off, turn arosimiliar than you think. I did it for years.

>=-=-=-=

You may laugh at this one, but once I moved an old washer out on the back porch, and when I put the mobile antenna on it, it worked like a dream. Another idea that works is to get an old washtub, turn it upside down, mount a k4a Firestick to the bottom, and mount the antenna to the middle of the tub. I have used a shopping cart, a washtub, a freezer in the garage, a propane tank (Stupid idea) and several other things. Be open to most any mass of metal. I once even left the mobile on the car in the driveway, and ran a new coax from it to the base indoors. I disconnected the coax each day to drive the car. When you want to talk, there is a way. I think that if I were you, I would use old coax, and run an inverted V. I did this inside the living room from the ceiling, and it was by far the best.

Yes, they are telling people this, but I know people on the inside. This is the strategy. Barjan wants to capitalize on the name and reputation Wilson has built, but the actual plan is different. Mark my words, and watch the future. Barjan does this with a lot of the items they carry. They are sold in most Truck Stops accross the country. Ask any truck driver what they think of the quality of Barjan products, and ask them the history of past products that Barjan absorbed. The proof will be in the results the next year brings.

Actually, I studied AC/Refrigeration for 3 years in high school. I
know the history behind it. First, there was brine, you know, salt
water! Propane and butane were used in the early days in
refrigeration. Refrigeration was much more important than air
conditioning in the early days. I don't think you'd want to use
either in a vehicle. You can imagine what might happen in a front end
fender bender with a spark.

Yes, to someone who wants to OPERATE a station.

The Johnson needs a separate receiver, which in turn means someone has to either go to the expense of getting a radio that they will modify to kill the RX section when the Johnson goes into TX mode, or get a real RX radio.

They also need to learn how to properly tune a transmitter (tube rig), and someone nearby needs to know how to fix the thing if it ever breaks.

I am not trying to scare you, just let you know what is really going on with it.

They do talk, though... God, do they ever talk!

Did Johnson make a matching receiver? As for having someone nearby to fix it if it broke, I know a couple of people who might know how, If not how do you recommend Buzz Brothers?... There prices seem a little high though.

On most CB's - yes. On most Ham radios, no.
On CB's with the mod limiter clipped - no.
But they offer something I desire more than "volume" (loudness). Different amplified microphones and their audio characteristics modify the tonal quality of the cb and that's why I use 'em.

Yes, i have one of the Midland 75-510 XLM FRS radios, the one that was dis-continued because of pressure from the FCC because it has a small magnet mount antenna, removeable antennas being of course forbidden.

The FRS radios are citizens band and FM only with a maximum of 14 channels covering 462 thru 467 mhz. The better radios feature an option known as CTCSS codes, which are a series of 38 sub audiable audio tones that allow a radios squelch to open only for another radio set to the same code. This cuts down on receiving unwanted transmissions from others. Max power is 500 milliwatts, and the better radios have voice operated transmitt capabillities that allow hands free full operation. As with anything, some radios perform better than others, but all of them are very usable. So decide what features you need, pick your price point, and have at it.

3677. Old POWER MICS CHEAP!

Well I thank you for your input, I'm currently learning morse code and going for my Tech license soon. Then why morse code you ask? I plan to move past Tech and further up the line. There is no reason why I should not begin purchasing my radios now as opposed to later :) With CW as a mode of operation this would make an excellent Classic CW rig... wouldn't you agree?

Thanks as always,
john

Angelina and Giuseppi were standing before the
judge in divorce court.

Angelina says: "Your honor, we benna marry 25
years ana Giuseppi he'sa always picka his nose ana when
we maka love he'sa never letsa me on top. I just canna
taka anymore."

The judge listens solemnly then addresses Giuseppi.
"Giuseppi, isa dis true. You always a picka your nose and
you never let Angelina on top? What you gotta say yourself?"

Giuseppi says, "Well your honor, itsa true. I picka my nose
a lot and, yeah, Angelina, I tella her she'sa gotta be on da
bottom. Itsa all go'sa back to when I'ma young boy. My
poppa, he'sa very smart man. I always follow ev'ry ting he
say. My poppa one day he says, Giuseppi, I gotta tella you
da two main secrets ofa hava successful life."

"Number one, you always keepa your nose clean. Ana
number two, never screw up."

Don't chop this radio up. There are no parts available for it. If the processor chip gets destroyed you can throw it away. We can't get chips for the ranger 2970 either. Unless you know someone who has them stock piled in the US. The 5010 is a fine radio. Take good care of it. Talk back "telk back" serves no useful purpose if your not using echo. If your radio fails to audio through the antenna, your talk back will not tell you that. If you are just wanting to get the correct response to your questions then talk back can be handy. You will always hear the right answer.

Good luck and God Bless

[After rereading Reflections I have concluded that without the
use
[of a tuner the reflected power does not return to the finals where
it
[dissipates as heat.
....Ok let's run with this for a bit.

[Rather it just subtracts from the original power
[coming from the finals. In effect this power is never generated at
[all. I believe Bill Nelson has been saying this from the beginning?
....I don't know if he has been saying that at this point because I
couldn't follow this thread that closely.
....Let me ask, where does this recombination / cancelation take
place? Output stage?Final?Coax? Antenna?
....If it was never generated at all then how is it we're able to
measure it and why do we strive to eliminate it?

[Use of a tuner will facilitate complete re reflection as I think
we
[all agree on. So that the only losses in this scenario are the coax
[attenuation losses for each trip made down the coax.
....What do you suppose is the mechanism for this re-reflection?
....Do you suppose it could be that this supposedly canceled
reflected power is momentarily stored in the values of +/-j the
tuner affords thru coil and cap combinations which serve to change
the phase of this energy to coincide with that of the incident
power.

[The heat that is generated in the finals with a mismatch is
caused by
[an inefficient operation, not by reflected power dissipating.
....Ok, you're on the right track with that last statement. Now you
need to ask yourself this, where does that inefficiency come from?
What is the mechanism that creates this inefficiency?
....Would it not be safe to assume that the mechanism that
dissipates this reflected power creates the inefficiency thru the
act of dissipating that power?

I have a Ranger and its a awsome am radio. Toll is right about needing a tech near by. I have Johnson tech about a hour drive from me so Im lucky, it could get exspensive sending a 70 lb boat ancor back and forth in the mail when ever you have a problem. Also tubes are not very tolerant being bumped around alot. As far as the recieve you can use a coaxial relay switch with a exsternal speaker and another radio for recieve. Its pretty easy to hook up.

UWANAGO2 wrote:
>
> Is there any way to modify a relay switching mic. to be used with a CB. I have
> a old Turner model NC450C mic I would like to put to use.

The first thing you need to do is see if the impedance
of the mic is compatable. CBs use low impedance mics
(500 to 1000 ohms usually). The impedance will often
be written on the mic. If not, you can measure the
DC resistance across the mic element (assuming it's a
non-amplified mic). If the mic's impedance doesn't
match that of the radio there will be a mismatch. The
larger the mismatch the weaker (less sensitive) the mic
will be. In other words, if the mismatch is large, the
radio will act like the mic gain is turned way down.

If the impedance checks out, the next thing to do is
make sure there are enough switch contacts to do the
job. Some of the old mics only have one or two sets
of contacts. It takes 3 sets of contacts to work most
of todays radios. If the mic only has one set of
contacts, forget it--you can't use it unless you put
another push-to-talk switch in it. If it has 2 sets
of contacts you can use it with radios that don't
require a ground-to-receive connection when the mic
is unkeyed. Old relay-switched radios and RCI-2950s
are like that. To see if your radio is like that,
unplug the mic while the radio is receiving. If the
receive audio is still there with the mic unplugged,
two sets of contacts is all you'll need.

Now, if the impedance checks out and there are enough
switch contacts, all you have to do is wire it up.
You'll need to know what pins do what on your radio.
In general, four connections are required: positive
mic line, shield (which is a common ground and the
negative mic line combined), a transmit line, and a
receive line. If the mic is unamplified it's pretty
easy to fugure out what does what. In many mics that
were designed for relay switching only, one set of
contacts connected together in order to make the relay
switch. You'll have to change that because today's
radios don't work that way. To make a modern radio
transmit you have to ground the transmit line. To
make them receive you have to ground the receive line.

So, that is your objective. You have to set up the
switch contacts so that the transmit line is grounded
when the key is pressed, and the receive line is
grounded when the key is released. Another set of
contacts has to be set up to open the positive mic line
in the receive mode. Once all that is done it's just
a matter of wiring the mic plug to match the radio's
mic socket.

I hope this helps.

There's a short circuit board trace next to the delay
capacitor. Cutting that trace removes the delay. Adding
a switch to bridge the cut makes the delay switchable.

not if I buy it.... its a 10 mtr amp.... as far as I'm concerned its homemade as I can't find a factory name on it anywhere it must have been made in somebodys home....maybe from one of those kits. ya recon..\

think its all in how ya look at it.

hey toll, i ran both (still with the jogunn 5+5 star) and with comparable
field
elevation and lack of obstructions the pdl and the jogunn are very similar.
the
difference i find is the jogunn has the better rejection on the sides. of
course
there is a better forward gain with the jogunn but when conditions are
moving
its not that big a deal. the jogunns are built extremely well (they stand up
to
the salt air surrounding this island)
and the pdlII's problem is that damn copper wire that has to be just right.

73, jim, eastern long island ny

and that wire will be your demise if you live in an Ice Storm prone area....

Good grief, so many DX clubs these days: Alpha Tango, Papa Wiskey, India Radio, Wiskey Wiskey, and the list goes on and on. And there's One Division, Section thirty-five, multiplication and division. Unless you're a member of one of these clubs you don't have a clue where they're calling from. Most of these sheep just give their call sign and no indication of where they're from. What is this, xenaphobia on CB? You only want to talk to people from your own club?

Well to paraphrase Groucho Marx, "I won't join any club that would have me as one of its members."

And while I'm ranting - what's with all these dxers, who the moment you hook up with them, are immediately asking for qsl info? Forget it buddy, I only qsl with people I actually talk to. Some of you guys are getting as bad as some of those hams who think an extended conversation is adding "qsl via the bureau" to their regular response of "You're 59".

Whatever happened to the good old days when people actually talked to each other?

3712. Stacked 5 or 7 element beams, Anyone?

Newsgroup: rec.radio.cb
Date: 1999-11-21 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <3837D642.6B2F4ACB@qnet.com>
Source record: 12117

Hello All: Anybody run a stacked set of 5 or 7 element Yagi Beams?

How do you like em?

Look at the MaCo web site, they have a MBSK stacking assembly for the 3, 4, 5, 6, and 7 element Yage Beams. And all the other CB antennas they sell which is a treasure of CB Antenna construction data.

http://www.majestic-comm.com/maco/support/index.htm

I heard a few of the boys on skip the other day talking about the stacked 7 element beams. Thought it would be neat to install a set of 7 element Yagi Beams, or a set of PDL II's Quad beam antennas.
Any comments....

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

3713. Best FRS radios? What features?

Newsgroup: rec.radio.cb
Date: 1999-11-21 00:00:00 UTC
From: MacUser@Penn.com
Message-ID: <MacUser-ya023580002111990938480001@news.penn.com>
Source record: 12118
Cross-posted to: rec.radio.cb,alt.radio.scanner,rec.radio.scanner

Hi Folks:

Not certain this subject fits exactly in these groups, but I suspect folks who know scanners and cb radios would have an opinion here.

I was thinking of getting a pair of those FRS walkie-talkies, maybe for Christmas, just to tinker around with, car-to-car communications, around town or on hikes and walking, etc.

They would be smaller than CB radios and cheaper (in-range) than cell phones.

But I see a pretty wide variety of models out there, with various options; security codes, channel scan, etc. And I've never actually used one of the radios myself.

Any out there have any direct experience? Any opinions to offer on what to look for, or pricing?

Thanks!

- Dave

The answer is: it depends.

Who are you going to talk to? If that someone is someone who is not familiar with radio equipment, then the most basis radio would be the one to get. A couple of channels at most. You don't need to get them confused with 14 channels and a gob of CTCSS tones and 12 buttons on the front of the radio.

I have a Radio Shack (some unknown model #) that I paid about $60 for, I think. It's pretty basic. I also have a Cobra MicroTalk3 that I paid about $70 for. It has everything -- *all* the CTCSS tones, channel scanning, tone scanning, vibrate, tone on/off, etc. It would probably confuse most people who haven't used scanners or other majorly complicated electronic equipment.

So what he is saying is don't worry about your antenna (thousand dollar max)...

You need to sell your house and move into a half a million dollar house to be on top of a hill and then you will have it going on.

1. Altitude
2. Amplitude
3. Attitude.

Those are the 3 most important factors in running a CB station.

NAS Miramar is gone!

They gave it to the Jarheads.

Then, they moved the Blue Angels to the middle of the desert....

So, I guess everything changes.

The people in Miramar thought it was bad having the NAS base their, what
with all the noise. So they moved it.

And let the Marines take it over!

Politics at it's best!

And if I told you that I was running all DaveMade in my mobile, but then had a large FET amplifier for the final, would you also question that?

Well, Dave doesn't make a FET box, so it would be impossible for me to even count that, wouldn't it?

Some people just don't use the mental capabilities they should have been given.

Good points. Maybe one strategy would be to buy a pair of the less expensive models to experiment with or to loan to others I would want to talk to who lack experience with transcievers, then maybe later upgrade to something with more options...but that would still be compatible with the simpler models?

Sounds reasonable?

Source record: 12141

I just got a new Palomar 225 from LCR. I really like it but the delay on AM will take a little getting use to. LCR shows a picture of the delay capacitor on there site for a modification, but how do you modify it to get rid of the delay on AM and still have it on SSB? Is it as simple as clipping the capacitor? Thanks.

Dave
I can always make special deals on certain tubes that I have in large quantities of tubes such as 6hf5,6dq5 ,30kd6, 36kd6 and other higher voltage tubes or qty of common tubes such as 6au6 ,50c5 ect lets talk.
Tubes such as 6lq6 6lf6 6kd6 6js6c are in high demand and I have a limited supply .People have to realize these tubes are not going to be around for ever and should rewire there amps with with higher voltage tubes such as 36kd6 ,30kd6 ,12jt6 ect. Tubes such as 8950s are virtually extinct .Yet many these of the amps can be rewired to 30kd6 35lr6 ect or drop the filament voltage to 6volts and use 6kd6 (a little less expensive than an 8950). There are good qty of 6jb6a & 6146 tubes around for the drake and kenwood radios.The yeasu ft101 is a different story 6js6c tubes are drying up fast yet there are mods available using different tubes such as a 6lb6 or maybe 23js6 & 31js6 tubes.Half the fun of being a ham ,cber or a electronic nut is experimenting with electronics. Unfortunately where not all elec. wizards and make boo boos .That is why we need techs like yourself around or dennis #12 (up here- in chicago) to resolve these problems.

happy holidays,Bob n9tew

I could be used on 10 meters legally, who cares if it is massed produced. How would someone buying it at a hamfest know if it is mass produced? How is one to know if it is mass produced or built illegally? What would be the differance if you built the exact same unit part for part. Could you use it then? Would it be the same as a mass produced unit.

After rereading Reflections I have concluded that without the use
of a tuner the reflected power does not return to the finals where it
dissipates as heat. Rather it just subtracts from the original power
coming from the finals. In effect this power is never generated at
all. I believe Bill Nelson has been saying this from the beginning?

Use of a tuner will facilitate complete re reflection as I think we
all agree on. So that the only losses in this scenario are the coax
attenuation losses for each trip made down the coax.

The heat that is generated in the finals with a mismatch is caused by
an inefficient operation, not by reflected power dissipating.

P.S I must repost because I forgot something

An example.....A scenario without the use of a tuner and
a 3:1 match at the load. 25% of the original power reflects.
The reflection upon reaching the transmitter in effect also
sees a 3:1 match. At this point 75% of the reflected power
subtracts from the original power. At the same time 25% of the
reflected wave returns to the antenna where it again sees a
3:1 match. This process continues as it diminishes each trip.

So that instead of losing 25% of the power with a 3:1 match
we only lose about 19% Again, not through dissipation in the

finals but from subtraction. .25 x..75 = .1875 or 19%

A new more accurate chart should be used. Something like
the one below.

1 0%
1.5 4%
2 10%
2.5 15%
3 19%
3.5 21%
4 23%
4.5 24%
5 25%

Source record: 12155

Greetings!

While most RF problems are caused by poor coax connections, I would like to know what you mean by, "not doing it all the time" - what are you doing when it does't cause this problem?

Driving? SWR from the antenna does change when wind forces the antenna to distort and change the SWR.

Lights on? Voltage low, so radio and amp don't run as efficiently.

Engine off? Same as lights on, but battery is constantly drained.

All the above can affect the power response the amp provides, and in turn, the problems with RF leaking into everywhere.

Grounding is important, but how it's grounded also makes a difference.

Care to elaborate?

While Dancing with the Mouse on Sat, 20 Nov 1999 09:32:24 -0500 (EST), the Modem interrupted with an MNI from "Limey007@webtv.net (Steve Rigby)", and the MotherBoard buffered this to Video RAM:

:+> I need help when Ikey up with my amp on it sets off my radardetector.
:+> intior lights. and my talkback gets real loud. It does not do it all the
:+> time. Irun a dx99 astorm 6 pill and flatline ant. Every thing is
:+> grounded Idont know what the problem can anybody help.

3751. Re: RCI-2950 VRS PRESIDENT HR2510

Newsgroup: rec.radio.cb
Date: 1999-11-21 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <383838a8.105281386@news.iserv.net>
Source record: 12156

Greetings!

RCI-2950...

Pretty radio, lots of buttons, knob and their concentrics can be hard to fumble with while driving. Works good, takes mods well...programming it might be a chore at times but not bad.

President HR2510/Lincoln...

My personal favorite, but layout has small buttons, with controls in good places, only a little tight at times while driving. Smaller LCD display than the RCI and really doesn't have a real programming problems. More straightforward to use than the RCI-2950, but the RCI does have a few more bells and whistles to it. Lincoln model offers variable RF power, the HR2510 does not.

For Base? Both the Lincoln/HR2510 and RCI-2950 perform well. Problems with TVI? Then I'd stick with the President. The RCI looks good and is realtively easy to use, makes a nice Base.

If Mobile, I'd suggest the President.

While Dancing with the Mouse on Sat, 20 Nov 1999 20:22:22 -0500, the Modem interrupted with an MNI from ""sheila" <cat88@helicon.net>", and the MotherBoard buffered this to Video RAM:

:+> HI EVERONE, HOW WOULD YOU COMPARE THESE 2 RADIOS
:+>
:+>

Message-ID: <19991121133912.23307.00000009@ng-fo1.aol.com>
Source record: 12166

Ok, so I see a lot of people here think a power mike isn't needed. Some say the engineers know how to make a radio better than the people who use them. Ok, that may be true, but this goes for all radio ops. Ham and CB alike. Do you think a power mike is needed?

My opinion.

I have heard plenty a stock mike, both on CB and Ham. I heard a $1900 dual band Radio on 2 meter FM a while back, and I think my ht soounder better, but when I was on 220, a fellow with a icom 220 base came on, and he put a d 104 on that baby, and I swore, I never heard a better sounding radio in my life. Pure FM bliss. Ok, I agree, DON"T crank up that mike to the max people, if you want to sound your best, but there is nothing like an old Truner, D104 to make a radio sound it best! Just keep the gain at a safe level, not only to sound your best, but also to prevent channel splatter.

Mo

Hee hee!

Just make up your own. Find out your countrie's prefix, USA is 2, then add two letters of your choice and then two or three numbers of your choice. That way if you be talkin' to the real club members they'll know where you are calling from before you tell 'em. For example,
2PP69, 2AA111, 2LK269
I think you get the drift. I don't believe in CB clubs - especially ones that base their operations on illegal activities. Even though the cost is minimal, the benefits are even more minimal. CB is anarchy - go with it!!!

MC is goin' home....

3765. Re: SWR Power Loss Chart

Newsgroup: rec.radio.cb
Date: 1999-11-21 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <38383b84.106013781@news.iserv.net>
Source record: 12170

Greetings!

Good points to make tnom...

However, in the text I see the word "incident". It's a key to looking at the reflected versus forward power losses. Nothing is "automatic" when it comes to power level reduction. In these pages, he immediately discounts the efforts he places into the fact that the output network is *not* reflecting power.

To a point, he is correct, *summation* occurs, or the "incident" power is still the same. Where I draw the line, is when he used the word "Automatic" - HUH?

It is an interesting way of placing the concept of putting the cart before the horse.

In some minds this might be considered "negative reactance/impedance" - where power is gained. But I know that this is not the case. And I'm glad he makes that reference.

The word "incident" which I used another moniker, "summation".

This incident power would be fine if the Coax, Radio, and Antenna were fine. We still have line losses, and he does make references to this, but he continues to describe the "working formulas" as if these were superconductors, they simply are not.

I know you're not flaming, the reference you state does prove a point in regarding the reflection power working *with* forward to give you an overall *net* value.

Since impedance has changed, we've also changed the frequency response of the antennas own response and reactance to this now broader range of frequencies generated by the interaction of both reflected and forward power. We have an interference pattern being generated by the system.

Because it now has multiple reflections working with forward power.

This net value, if not dissapated, generates a gross value that over a period of time, these levels of power still accumulate to an overall value that can still work into the impedance output network and into the tank circuit.

In a single sentence, the radio responds to this by "I'm swamped".

Literally.

There is very little dissapation in line and antenna losses, except for heat from little ohmic losses and perhaps a harmonic or two the antenna and coax spur off, but even then, we're proving that the impedance change is occuring.

The fundamentals of the frequency and overall bandwidth of the antenna simply generates more of the problem and can cause runaway. Sure, some "R" is there, but this cannot totally remove all the incident power present.

So how is this overall net power removed?

This goes back to the pages of 44 and 45 in the reference, where Maxwell makes a stunning statement that knocked my socks off...

Where does the conclusion that this reflected power is never re-entered into the radio? Remember that the output is unbalanced. Otherwise the termination would occur there with a zero net result.

We'd never need a radiator.

Remember that inside the radio, the output network is looking for 50 ohms unbalanced on one end, but the final on other side is far lower - remember the bandwidth.

This doesn't mean that the network rejects this power, it's not, it's simply reverting it to a lower impedance that the tank circuit will have to compensate for, and this usually means into the final.

The ohmic values converted, are small, but if allowed to accumulate to a value, these can cause serious side effects. The bandwidth the tank circuit must provide, needs to exceed this value. And when SWR is low enough, this can occur.

It reasons to believe, that the transistor itself is designed to be operated at a lower given wattage, to accomodate extra bandwidth and power dissapation capacity or Safe Operation Area for a wide range of values presented to the impedance network and the output tank circuit.

Had this not been compensated for, the transistor would fail almost instantaneously.

This can be proven by simply running the radio without an antenna.

The impedance network itself is designed to reduce power when the load simply is not equal. How this is accomplished, is thru various means, and Maxwell dismounted on this.

Thats my irk.

How can someone dismiss the events causing the "automatic reduction of power"? Or the reduction of power from the radio, as "automatically" - this is a vague reference.

He's solving the problem, but the wrong way. The need to understand how the radio is responding to the mis-match is not "automatic" -

there is no sensor, only the network. How the radio responds to the mis-match is thru the network. The reduction occurs when the output tank becomes swamped with a now different "R" value the matching network now senses.

There are two ways the R-value the output network can work, either reducing the impedance to a lower ohmic value, or raising the ohmic value - both accomplish the same task. However one lowers voltage, while the other increases current - between these two, the output of the final into the tank circuit and the load present on the other side, affects the power available by the final.

Since Voltage and Current at the tank are not at unity, dissapation occurs. The "automatic reduction of power" that Maxwell immediately notifes the reader. It kills the whole effect of what he's describing as "perfectly safe" to use antenna system with 3 to 5 SWR mis-matches - because of neglible loss.

This proves the point about how the radio "doesn't" see reflected power. I'm sorry, but it does, otherwise "reduction" would never occur and we'd have a lot of unhappy campers out there.

To have all the power "eventually" arrive to the load is a fault. No one seems to remember that the overall power summation problem has already been sensed by the internal circuits within the radios output network and power has appeared to be reduced.

That poor final, too bad it couldn't speak. It'd be screaming at us right now if could.

This power reduction, is proportional to the load and reactance sensed on the line by the network, and has already forced a power reduction. However, there is only so much power that can be reduced and still provide stable operation.

This is where the runaway occurs. And if allowed to continue, the output network fails to compensate and the final is left seeing a drastically different level of impedance than what it was designed for.

I'm sorry, but Maxwell needs to take some time and reconsider the reasons behind the power reduction due to the change in the load.

Everything is not "hunky dory" and full of roses, remember that roses have thorns, to say what he does about transmitter power reduction is "automatically" done at the radio is a real bonquet!

Because of changes in the reactive load, and the overall R value of everything included, the radio can work into something above the low impedance of the tank circuit, and less than infinity. Bandwidth is an important factor here. If we had an ideal amplifier, we'd have everything linear from DC to EHF, but we don't.

The power reduction effort Maxwell refers to, is due to the mis-match that causes the radio to reduce it's forward working power. Not simply by resistance, or impedance, it sees in the load. It's "seen" by the output networks ability to change the impedance of the tank circuits own response to the network. A feedback which affects power delivery by the final, due to the output networks own response to the change in the load.

If the output network was "totally reflecting incident power" the final would never see any true power change, and would still deliver full power and we'd have the runaway effect of damage caused by it. In fact it can, but once the level of voltage and current are met, it can't go any higher due to the final only has so much push into the network from the Tank circuit. When "incident" voltage or current rises, the overall net effect of the finals' ability to deliver into the load is reciprocal - there is less and less room for overhead, or bandwidth.

It's interesting to note what junctions fail when a final "fails" due to high SWR. The power is reduced, but the junctions that are affected are pairs related to Base in cases I've found blown finals in.

Why? Due to the base region driven by the driver, exceeding the RF power levels present at the collector, and *wham* the PN junction erupts and is punctured, the dead short, or the Base pumping power into the emitter, exceeds the surge limit because of collector voltage, and a fuse goes.

Why?

Remember that "incident power" reference. This tends to act as a catalyst in making such references, but not really giving us that understanding of what the radio is attempting to do.

"Automatic Power Reduction", This is simply not the case. A change of impedance at the Tank circuit of even .4 ohms, would have a dramatic effect on power in both voltage and current the network sees, and subsequently, Maxwells observation that "Power is automatically reduced due the output network of the radio sensing a different Zl".

Sure, the radio can produce full power, and if the impedances are not equal, we do suffer a loss as an increase in reflected power. Simple mis-matched load. A weak or low voltage battery, powering a higher voltage lamp, you get a dim filament with lower resistance across the filament - makes a good analogy.

To re-coup that power, is thru reflected energy, this settles fine...

... but to say power is automatically reduced? I need clarity on this.

The power potentials that the final must deliver into, have changed the response curve of the final. An SOA parameter, if a radio is properly designed, a 30:1 SWR can be tolerated indefinitely.

Can't guarantee power, but it will last a long time.

I wish these "black -Comedy- Boxes" were that simple to understand.

I'd like to know how to define "Automatic" without agreeing that the
radio is receiving reflected power to adjust the forward drive level
accordingly. Something is coming back down to the final.

The network is only the messenger.

Greetings!

Although you do have a point, to arrive to a value without having to change the power reading for calibrate, makes it easier for first-timers and a general consensus of what the channels you do have, have to say about the match they're in...;-)

In case of a well-tuned antenna, adjusting Calibrate is a waste of time for each channel. The SWR meter can notify you once you have a reference on one channel, about the condition the antenna system is in.

Now, if you're really concerned, then yes, it's your radio.

But it's not necessary, and if you have to do it because of the change in Calibration power level on different channels, there may be a larger problem with unequal tuning of the radios TX side.

To get a reference, is simple. But the problems you suggest, can make the radio appear to need a good tune-up because more power is being used on the other side of the channels, than made equal across all the channels.

While Dancing with the Mouse on Sat, 20 Nov 1999 17:36:12 -0500, the Modem interrupted with an MNI from ""Scott (Unit 69)" <upplus@hotmail.com>", and the MotherBoard buffered this to Video RAM:

Hi all:

I have for sale some radio's and service manuals, to go with them. Or you can purchase the manuals separately. Following is the link, for those interested:
http://home.att.net/~j.dow-kb2tlb/home.html/radiocb.htm and for Photofax:

http://home.att.net/~j.dow-kb2tlb/home.html/phfact1.htm

tnx,
jim/kb2tlb

end

If you had the biggest amp in the world I would still think you are an ass hole so whats the difference?

And if I told you that I was running all DaveMade in my mobile, but then had a large FET amplifier for the final, would you also question that?

All it takes is someone with a few bucks and they can have one. he has made several fet amps. Offering them for sale to the cb community would be useless. For starters cost is a major factor and they are not allowed in the keydowns If you tried to get into a sky class with them people would cry and complain that they are not allowed.

I mention that point due to the fact that most radios have been fudged with
in some way. Not all techs are completely competent.

Actually Toll, the Angels are still out of Pensacola and practice out of El Centro. They lost the lead and the other solo a couple of months ago so they're out of commission this year. The reason they went from moving the NAVY out of Miramar was because of the F-14D's doing hi-speed take-offs at 3rd stage afterburners and breaking the sound barrier around the area. The Sound barrier corridor runs right over Jay in the Mojave but the Tail-Hooking Jet Schmucks do crap whenever and whereever they feel like it. Trust me. I'm in QA for our new up and coming F/A-18 Superbee and these F-14 transitioning pilots think they rule the world. F#@king assholes!!!

Yes, a CB can be made to duplex. I have listened to the groups on 25 mhz doing just that for years. One radio, I think the Ranger 3300 could duplex. It is possible.

I own and/or have tested over twenty models of FRS HTs.

The BEST are...<drum roll, please>

Well, if it's sheer simplicity of use - get a pair of the Vertex VFX-10 HTs. Under a hundred bucks each. Full power output. All 14 channels (weather channel reception, too). Simple to operate: just two knobs, ON/OFF/Volume, and a chennel selector. Couldn't be easier. Can NOT be out-performed by ANY other FRS HT. Has DCS encoding if you find all available channels busy in your region.

If it's full-features you want (LCD display...audio inversion speech scrambling, et al) then the original Kenwoods are now about 70 bucks each. Although "only" 300mW out, you will never know they do not have the full FRS legal output.

There are many bargain basement models out there - and, as in life, you usually get what you pay for. Radio Shack hasn't produced a unit with good case material yet. The cheapies at discount stores for fifty bucks a pair are, in my opinion, not worth playing with.

My choices have been Kenwood and Vertex for a couple years now ... both quality products from reputable manufacturers.

I checked my match and it is way down around 1:2 or 1:3. I've made sure the attenuation switch is at full. The first notch doesn't even cut out much, maybe 2 pounds. That switch might be a bit dirty maybe, but all the switches seem to be working good. Anyone else have any ideas?

BTW, analogue dual dials on this rig.

Hope this one works...other posting had no return address.
So here it is again.....Tnx for the bandwidth.
Have large box of old amplified microphones. Turners (base and mobile),
D-104s (Base),
Johnson, Sure, Cobra, some other non amplified mics in box also. Been in
storage 20+
yrs. Not tested but stored without batteries! All boards look complete.
Good shape
except D-104s tarnished. No water damage just age. 78 mics. Amplified
mics $25.00
non-amplified
$8.00. Whole box $300.00 plus shipping from 92025. COD add 6.00 per
shipment.Money
orders only.

11 D-104s, 26 amp. mobile Turners, 15 turner base (amp. sidekicks), 5
cobra amp
mobiles, 21 non-amp assorted mics.

thanks for reading,
John Pressman

The trick with throwing a dead cat is to make sure he is still relatively fresh. I find that as the cat gets-well aged shall we say-the tail tends to separate when you spin it over you head. And yes, the houses are sort of close.

>Now that you know your radio is working, forget about it
>and concentrate on your antenna....

What about the antenna? It's a 102" whip on the back of my pick up truck. I hope your not going to suggest a 5/8ths vertical for my truck.

If I trust my swr meter on the front of my uniden, I'm getting 1.2:1 swr. Tuning it is going to be a challenge because it has a hard nob on the tip and something that looks like a bolt welded to the bottom.

You cannot subtract power. It's one of those laws of physics; power
must be conserved.

You can, however, add and subtract voltages and currents.

> Use of a tuner will facilitate complete re reflection as I think we
> all agree on. So that the only losses in this scenario are the coax

> a 3:1 match at the load. 25% of the original power reflects.
> The reflection upon reaching the transmitter in effect also
> sees a 3:1 match.

Why would reflected power see a 3:1 match at the transmitter?
...is the transmitter impedance 16.66 ohms? ...or 150 ohms?
Why isn't the transmitter impedance 50 ohms?

> At this point 75% of the reflected power
> subtracts from the original power.

Again, power is always positive. It may travel in different directions
but it is always positive. Summing power will always give you more,
not less.

3825. FRS radios are nice, but...

Newsgroup: rec.radio.cb
Date: 1999-11-22 00:00:00 UTC
From: Toscano <toscano2@ix.netcom.com>
Message-ID: <81alaluni1@nntp9.atl.mindspring.net>
Source record: 12210

...when will their widespread modification be commonplace?

I have only seen one project, owned by an older gentleman who frequents my local CB shop, that "behaves" similar to a ham radio. I don't know what mods he did but it began life as a "Unwired" FRS radio and now receives audio from something like 440 to 500MHz and broadcasts on 440 to 475. He said he knows how to make a power mod as well but battery drain is an issue.

Questions...

1) Could this guy be telling the truth? He did add three buttons to the radio's display and I had him key it up on several different freqs and with my PRO26 handheld scanner with a magmount mobile antenna I was in fact able to hear the guy lima charlie on all the freqs he claimed he was on.

2) Will FRS go the way of CB with modifications galore, Linear Amplifiers, beam antennas, etc etc etc? Who has seen this starting to happen yet? Anyone?

No you can't get a ticket for telling people to slow down, and as for the amp wait a while and learn before you get it, it seems to me like your new to this and you WILL make mistakes... better you make a mistake and blow your finials then smoke your amp. If you are still going to get an amp keep it under the passenger seat out of sight if its small it will get fine ventilation under there. I had a boomer 600 under the seat and it worked great. I blew it up because I made a DUMB antenna mistake. If the cop sees it, "Why its an amp for my stereo, officer :)" More likely then not that will be the end of the conversation. There is a lot more info to know then this, but you'll get the general idea.
3 rules for an amp
1. LOW SWR below 1:1.5
2. NOT over 4 watts... unless its a high drive then under 10 for the average amp.
3. get a GOOD antenna wilson 1000 is the best in my opinion.

Lastly and MOST important when on the radio DON'T be an a$$hole.
Have fun with the radio,
john(aka aardvark)
P.S. start stock then work your way up, think of a big radio as a race car... treat em fine and you'll talk for years but there very delicate and break a lot easier... a good stock on the other hand can take a hell of a beating an keep transmitting.

Newsgroup: rec.radio.cb
Date: 1999-11-22 00:00:00 UTC
From: klhokanson@aol.com
Message-ID: <19991122014303.05679.00000101@ngol04.aol.com>
Source record: 12214

I always heard that to calculate the length of coax you used the following formula:

f = Frequency
VF = Velocity factor of the coax.

246/f = 1/4 Wavelength.

246/f * 2 = 1/2 Wavelength

((246/f) * VF) * 2 =1/2 Wavelength

Is all this correct? It seems to work real well.

Well I planned on only getting 100-200 watt amp. Not worried about messing it up. Im not going to be the one touching it. Have someone that is going to do it all for me. I pretty much want my cb for talking to people I know in town. But I would like to talk on skip every once in awhile. If I even get a radio good enough to do it lol..

piker

I dont disagree with your input. when i had my shop i would even hand them the book on installing ect ect. the problem is on the groups if you go to any others you ask a question and you can get an answer, to not want to help your fellow man with some keyboard strokes is non american.
Im sure if asked most people do help.
Its alot different then walking in someones shop and asking to have something fixed for free.
you sound like you are an honest shop owner and your customer base is probably very happy.
All I wanted was direction on a easy question.

Just as a note to people on the group who care...

Svetlana has announced that they are dropping the 811A line of electron tubes.

They will continue to build the 572B, which will drop into the 811A socket. The 572B has long been a favorite tube for replacement, as it is rated higher than the 811A.

So, for all you people owning the Ameritron amps based on the 811A... Sorry. Once again Ameritron has produced something that won't be supported in the years to come... (Ala AL600).

I use the top pole from fencing and it works well. The life expectancy
won't be as long has a pole designed for a mast due to metal fatigue.
The wind will eventually bend it. But I have seen antenna using the same
pole and are up for more than five years.

> (the FCC code test)...

"Fun" is only a subjective opinion, which is why I didn't use the term. Aesthetic, seemed (to me) to be a better fit, as it describes something that is appreciated more for is "artsy" appeal, than actual practical application. I have no problem understanding the difference between CW "the mode" and the CW testing requirement.

The biggest problem is that the people on the "pro" CW side see any proposal for the reduction of the *code test*, as a signal that they might lose the ability to use *the mode*, so they vehemently uphold and adhere to the out-of-date requirements.

I would think that CW proponents would welcome further segregation of the testing. If CW proficiency were to become optional, rather than mandatory, then the people, who take the time and effort to learn and use CW, will be the ones who will fit in best with the people who are already there. Having something shoved down your throat does not foster the best attitude, and many may develop an "anti CW" attitude, because of all the pain they had to go through to learn something that they have no use for. This could lead to deliberate interference, or lack of respect for the users wishing to use CW.

People who like CW, and the nostalgia that it represents, should continue to use it, and should always have a place to use it. But that in itself, is no reason to continue to force everyone else, who are trying to move toward the 21st century, to learn something that is as archaic as the Titanic.

Actually, the FCC is in full agreement with reducing the code requirement. It's the old fossils at the ARRL, and other "Keep CW at all costs" groups that are fighting the trend.

>I think I have this straight--they and anyone who supports a continued
> morse testing element for HF access are wrong.

There is no modern reason to keep it as a requirement. Because YOU or others choose to LIKE it, is no reason to expect that everyone else has to like it too.

CW is a MODE, like SSB, AM, FM, SSTV, AMTOR, PACTOR, PACKET, FSTV, RTTY, QPSK, etc, are modes. There are no special testing dedicated to any of these modes, so why should CW be any different?

Maybe we should still require testing on the care and feeding of horses, when we take our driver's test......

"They". Who are "they"? If you are refering to the engineers behind HAARP, that hardly represents the conditions that CBers typically run under. HAARP has a very high gain antenna array,(along with a HUGE amount of transmitter power) with the acreage to boot. Something the typical CBer, even the "loud and proud" types can only dream about.

If I recall my HAARP information correctly, they were able to "heat" the ionosphere, which can cause some ionization, which will dissipate once the initial "heating" is removed. This also gave rise to a number of conspiracy theories, about the HAARP's real agenda, which was to control the weather.

In conclusion, while it may be possible for a special, very high power ERP station like the HAARP to "create" temporary ionospheric conditions which may support DX, it is still out of the reach for the type of equipment normally found on the CB band.

Nope! With the caveat that it cannot happen with "tuneups". If someone wants to take the time and expense to add the parts necessary, to accomplish this feat, then it can be done. But that is hardly cost effective.

I listen to 75 fairly regularly. While the behavior of these fine, upper class hams, leaves a little bit to be desired, they are not running noise toys, echo boxes, and other gimmicks. What they do have is a bad attitude. Most of the problems on 75 can be catergoized either as territorial in nature (This was OUR net frequency in 1955, and I'll be damned if I stop using it now!), or differences in opinion (Liberal, gay loving, democrats vs. God fearing, republican, christians).

The "ugly" side of CB, has people who jam other people, just for the sheer fun of it. Destroying other people's fun, is THEIR fun.

While I frown on bad behavior of any type on the radio, I can understand someone fighting to defend something that they believe in. But there is just no excuse for jamming for the hell of it.

But I can't believe that you can't see what a horrible pain in the butt,
that this would be. It's so much easier to have one station transmit,
and everyone else net in on him, than for everyone to play the "how's
this, how about that" game back and forth with the "net controller", as
they blindly move their TX freq. until it's on.

Perhaps the best system, would be to have the clarifiers synchronized,
and everyone tunes in to the "net controller", then they press a button
and the clarifier becomes an RIT only, for any personal "touch ups".

This is a gross exaggeration of what happens. It's very rare that the TX
and RX sync is off THAT much (Unless the radios was "done up" by
Billy-Bob, the local truck stop gas attendant and part time CB tech).
Usually what is the case, is that some people use the clarifier as a
"tone control", to adjust to their preference in a person's voice pitch.
This will lead to a slight correction, but you are still far from
unitelligible.

All it take is discipline. Discipline to NOT walk the clarifier the
second someone sounds slightly off. I've been working SSB for many years
this way, and have not had a real problem, except for newbies, and they
learn fairly quickly.

At least back as far as the early 70's, if not much farther. I see one
in my 1973 Lafayette catalog.

> HI EVERONE, HOW WOULD YOU COMPARE THESE 2 RADIOS

I have one of each. I like them both, but for different reasons.
Feature wise, the 2950 wins hands down. Memories, variable power,
greater frequency range, easier to read display.

Performance wise the 2510 wins. Better noise blanker, better adjacent
channel rejection, more power output, does not overload on strong
received signals, the "S" meter is better. Frequency stability is also
better.

Some of the 2950's problems, I have managed to correct, which make the
radio decent enough that I've used it mobile now for close to 7 years.

Well, Well, Well !
I see that ONE has chosen to NOT read the post and conclude that it is too nice to accept so the ONE has chosen to act in a childish way by running off at the mouth.
How WELL Do You Know Those on the list below?
How WELL Do You Know Me?
How WELL Do YOU Know YOURSELF?

Ask yourself those questions before you send off another critique of a polite goodbye! And, Smile to yourself when you provide the answer the way that you would want others to smile at you when they write back to you.

YOU can ONLY control YOU!!! Not Others!!

And by the way, I don't play your kind of games -I might WIN; and even if I don't beat you at your own game -I still walk away A WINNER, Every time :)

So, Do Yourself a favor, don't find anyone else to play your games.

I am referring to you "Handy Andy".

No, I am not bailing out!
And I chose to leave under my own accord, not others.

I have had weirdos, like yourself, get on the radio and cuss and run their mouth telling me to shut up --- I don't let others like YOU tell me what to do, when to do it and how. You Heard?

You Do NOT have the knowledge to tell me what to do!

Evidently you just wanted to hit the reply icon and started typing without really understanding the post.

Evidently you are NOT a real American as others claim!
Probably because you enjoy blasting other AMERICANS for the right to FREE SPEECH and CHOICES! Do these terms have ANY meaning to YOU?

I'll bet some of the human beings that I listed are composing a letter of their own to send to you as well. Then maybe not! You decide! I'm just gonna sit here and print out these posts that you send "trying to shake me up" Yeah, whatever! As If!

Don't be foaming at the mouth about me talking about "my friends" behind their back.
You need to GROW UP and/or SHUT UP! Your choice!
Evidently you DO NOT know me at all!

Next time read a Dictionary, Thesaurus or another means of finding words that make sense.

>Hey "Mr. CB", You read the post wrong!

: Can someone tell me or point me towards the difference(s) between the 1011C
: and 1011D models? Thanks
: Mike

Depends on when it was made.

Major differences:

Solid state balenced modulator circuit.
Jack and internal circuit for the external frequency counter option.
External ac outlet.
Revised VFO dial to indicate 40 channels.
Some small cosmetic items.

Feel free to Email me if you have other questions. I have a few
around and have been servicing them for many years.

cheers
skipp@pilot.ucdavis.edu

I am already a HAM Operator!
You missed your "ultimate-warrior" chance to detour me away so relax and chill, you heard?

I am aware that your printer is active so you can print out the hardcopy later and read at your heart's content.

YOU do NOT have the knowledge to tell me that I insulted the friends that I made!

I did not BAIL OUT!
I CHOSE to leave under my own accord.

You STAY in school to get EDUCATED!
Then again you must be getting home-schooled on the CB! Yeah, whatever! As If!

I don't HAVE to keep the fact that I have a license of ANY type/class to myself! YOU don't tell ME what to do!

"Appliance operator", huh?
yawn yeah, whatever!

Grow UP!

This may be the 90's and the end of the 90's is closing in, nevertheless, "Just because YOU got the Power -that don't mean YOU Got the Right" to tell others how to live in this decade!

I don't take crap, or kiss ass, or suck dick in the "workplace" or the in the "social arena" that these "GEN_Xers" have established!

I am an AMERICAN!
I Salute The American Flag!
I Spit on Communists like Marilyn Manson and Saddam Hussein!
I Salute to All Branches Of The Armed Forces!
I Welcome Visitors From Near And Afar in Peace To America!
I Love My Country! It's the Government That Needs To Wake Up!

I hope that sums it up for ya! IF it doesn't,
"WELL, EXCUuuuuussse.... MEEeeeee!!! !"

yes and if they go around telling everyone how to do there own job there won't be any tech work. You have to pay for a chiltons manual you brain fart just like you should pay for the info you want. Look on the front of engine compartment they have the spark gaps there . How do I know that from experiance, the same concept as what a technican has learned over the years . What happened to your shop ? give out to much free info the people didnt need you anymore Freeloading Loser.

Gunn is selling them for Dave and the price is $550.00 this should include the driven element "Which is the Rod" and the reflector with its mount, Perhaps you are somewhere that it isnt worthwhile to ship the 4- 12' sections of aluminum cheap. And it may be cheaper to get your own elements than to pay the shipping for the 4-12'ers

Arent you the same fool who asked about using fence post for an antenna
If you owned your own shop I may go into business since I can see it doesnt
take much intelligance to do so. So take your good karma and go freeload
somewhere else and quit being so cheap and pay a tech for what he knows
instead of trying to pry it out of people .

It all depends on the antenna. You might get a range of a 1-2 miles
with a 4 Watt handheld.I might be wrong, but I think that GE is just
trying to cover thier ass here.....

get a small antenna that you can stick on the roof of your car quickly
if you want increased range.

1) B&K 2040 with Eprom Kit and Digital readout for Export Radio Repair. (3 bands of 50 channels) 5 - digit red LED readout. Looks awesome and is calibrated to be perfect. Readout sits on top and matches with the 2040 Eprom Kit. No Holes in 2040, Readout is automatic for band selection. $350 plus shipping.

2) 2 - B&K 1801 Frequency Counters. One works and is perfect (Calibrated) and one is all there but parts only (will not count) $80.00 plus shipping.

3) Leader LSG-227 CB Test Center (Like the 2040 except Digital Readout, Has twin lit meters and all that stuff) NO -RF output , I think it is the 5 volt supply , Don't feel like fooling with it. Nice shape. $75.00 plus shipping.

http://home.mpinet.net/grassa

2040 and readout can be seen at this link as well as other stuff...

Bill

With the rubber ducky antenna that comes with it you will get about 3/4 - 1
mile in good conditions.
If you are going to use it for emergency purposes get a 2-3 foot mag mount.
I have the exact same setup, and she gets out very well with a two foot mag
on the roof of the Windstar. My tests show about 6 miles. Just go to rad
shack and show them the handheld and they'll set you up with the necessary
connectors. (don't spend more than 30-35 bucks on the whole setup.) If you
really want to get out get a Wilson 1000 or 5000 with the (short load i
think is what it is called) then if you like it you can upgrade the radio.

How far can you throw it?

In all seriousness, CB frequencies require a long antenna. Any external
antenna will help. Although a handheld's range is limited by the effectiveness
of the antenna, from the third floor, on a quiet night, several miles
is possible.

Really, what band would that be?

I don't recall the poster ever saying if he intended to use it on any one band at all.

Trying to start crap again, aren't we, Joey?

I have a Cherokee CM-10 with a Cobra CA75 power mic. I have a few questions about different things I've seen, and heard. First off I saw some type of filter for the receive end to cut the excess junk out. I can't find it again. Basically the manufacturer touted it as the way to reduce if not eliminate bleedover. Does anyone know what I referrring to? Some people have been complaining that I sound muffled, I listened to two people using my radio one male and one female and they both sound like they're talking through a muffler. Could this be the mic? Also on a similar note most of the people I hear sound the same. Is there a way to add a tone control? I have a print, but I have to get it enlarged so I can read it, it may be obvious to me then. Are there any pieces of electronics that improve the quality of my radio, no echo, no beep, and no noise toys. I hear good and bad things about everything I see. What's worth it?

==========
Toll, when was the last time you priced fet's perhaps you can qoute me some
prices for fets comparable to the 2879. I also understand they can be
paralleled since this is what dv has showed me with some of his prototype's

>
> Yep, they shouldn't be used!

> > keydowns
>
>
> Not totally true. 28 volt and higher devices are not allowed in any class
> BUT the sky classes, and they get beat, too! However, a 12 volt FET is
> completely legal!
==========
As we all know there is not a set of rules for keydowns but try getting into
the sky class with them It may work the first time around but after that
they will ban them or guys won't run against you the word gets out quick

when new technology arises. It is just like the davemade rod of god, and his voice chip after you whip them a few times they cry "No Mas" When after all they can have the same thing you have. Most guys at keydowns are not technicans and you could have the spec sheet on the 12 volt fets etc and they still wouldnt go for it.

>
> If you tried to get into a sky class with them people would cry and
> > complain that they are not allowed.
>
>
> If you tried to get into a SKY class, where the only rule is that their
> isn't any rules people would cry foul? On what basis...
==========
Maybe you can ask BlueGill and Ghostrider this question they will not key against anyone using the rod of god antenna in the sky class, what make matters worse is the guys who wanted to use the big antenna against them are running 2-3000's against there 2- 10,000 who is afraid of what here ? , then the big boys threaten to pull out if the keydown will allow them and what happens then, the people running the keydown don't want the $big boys$$ leaving so they say no. I have seen the same thing in dc sky . I thought sky was just that sky! Run what you brung!

Just to let all those interested know; I tried the easiest remedy first, which was to simply move the antenna from the trunk lid to the middle of the roof.

Tada!!! Flat. 1.1 all the way across. Only drawback: with a 56" whip, this is a big-ass antenna! I have to take it off the car before it goes into the garage. But hey, small price to pay. The difference this antenna makes is amazing.

Hi Jonathan,
I too, drive a full-size (K-5) Blazer.What I did (and it KILLED me) was to drill FOUR holes in the left rear quarter-panel near the top, and put in a ball-mount. I then ran a Penetrater BIC-11 long shaft antenna on a quick-disconnect mount. It got out GREAT !!! No problem. But then, a guy at work talked me into putting a Wilson 1000 on the METAL part of the roof, between the driver and passenger. So...I did. The Wilson DID perform BETTER than the Penetrator, but now if I want to park in the garage, or the airport parking lot, I must first remove the Wilson. If I could do it all over again, I would have STAYED with the Penetrater antenna with the "quick-disconnect" antenna mount. The Wilson only did about 20 percent better. But of course, it was mounted in a better location. So, pick your poison...wipe off the tears, and whip-out the DRILL. You'll thank me in the long run. Been there, Done that!

MIKE (707)
Jonathan421@webtv.net wrote in message <20962-3839936E-40@storefull-173.iap.bryant.webtv.net>...
HELP...(newbie here) I just bought a Midland 77-115 (seemed like a decent radio for $65 new.....?) and I need to buy an antenna for it. I'm using it in a 4x4 with a full removable fiberglass roof (Blazer).. I prefer the look of a pair, but they would have to be mounted on my mirrors or bumper... Where can I find something like these, and what kind would be best?? I heard there are drawbacks to using two antenna, is that true?? (remember this truck sees a lot of wheeling and low trees) Any help would be greatly appreciated....
thanks
P S (if that radio WAS a good deal, I can tell u all where to get one)

k-bye,
Jonathan

Then why was I asking if Johnson made a matching receiver? I have a very nice scanner for 25-1300mHz 10m-23cm in fact I'm listening to it now. As for further down the band, the Johnson Viking II is, and only is, a transmitter. The receiver will be next.

Perhaps this is just my take on it, however I was under the impression that the bands it is capable of transmitting on was dependent on the VFO which I will be adding to the unit.

>
> A good, used, 80's era transceiver would be a better all around

> the air.
>

I'm not an appliance operator, I derive much enjoyment "using" older tools, they may be a little harder to operate, that doesn't bother me, the quality of craftsmanship far surpasses that which we own today. I own an Allis Chalmers B-112 garden tractor which was produced in the sixties and when restored will eat a craftsman tractor and many others. As for all band coverage please see above where I referred to a VFO.

>
> The Viking is a fine classic rig. But except as a CW nostalgia station
> (or eventual 75 meter AM driver) it hasn't much practicality to offer
> the new Tech (or Tech Plus) ham.

Practicality is derived from use, if I choose to use it and enjoy using it then its practical. It has served many hams since 1953. Just because a company released the biggest battiest newest thing doesn't make the predecessors of that object junk... that only applies to computers.

Thanks for the response,
john

Let me play Devil's advocate for a minute.
You do realize that is not impossible to get a zero reflected
power.
All you'd need to do was match the antenna and run enough coax
to waste the remaining reflected power in the cable dielectric and
copper.
Or maybe find an isolator that would work at such low freqs.

Actually, I think the idea of reducing the code test requirement induces a jealous reaction on the pro-CW side. If the requirement was dropped, or even reduced, they would feel it is not fair - the new people are getting something that I didn't.

From what I have seen, they are already jealous of the no-code techs who get to use all those frequencies in the VHF+ bands, without taking the code test (remember the code test was required, to use any ham frequency, before the no-code license). So, from their perspective, getting rid of the code test would only be adding insult to existing injury.

However, lets face it, the code test is going to be dropped eventually. Ham radio is about the only radio service that still uses CW on a regular basis, and it is certainly the only radio service that is still tested for CW skill.

In the end, people will have to recognize that, whle CW was once a necessary part of radio communications, it is simply not needed in a modern world. Today, for military and commercial use, there are more efficient modes that offer even more reliable communications. That fact alone makes it rather difficult to continue to justify the need for testing of that mode in the ham bands.

Message-ID: <81bmpv$32d$1@ash.prod.itd.earthlink.net>
Source record: 12352

Well, I'm sure mods will eventually start showing up. Some radios
may be modable, and some won't.

Alinco for example makes some really nice compact 2M and 440UHF
HAM HTs. They also make an FRS radio that looks awful similar.

While I don't know if you can mod the FRS radio to 'expand' it, I do
know
that you can mod the 440 radio to cover FRS.

But the problem here is how wide can you make the FRS go? And is
it worth it?

If you 'expand' the FRS, chances are you'll just be able to expand into
other public service areas, which WILL get you noticed pretty damn
quick, and you will probably have a chance of getting caught that is
orders of magnitude greater than being caught freebanding above
11M. Unless you are out in the country. But then, if you're out of the
mainstream, why would you need to open up the coverage of your
radio?

Although, I have to admit, being able to use your FRS to listen to other
services is a neat idea. But 2 digit displays??? Come on!

Well, Dave, if you actually knew what you were talking
about you might at least have a beginning of a point. But
sicne you clearly don't we just have to dump you into the
same category with Loose Lennie the Louse.
The proof will be found in comments to the FCC regarding
the NPRM.

>
> I would think that CW proponents would welcome further segregation of
> the testing. If CW proficiency were to become optional, rather than
> mandatory, then the people, who take the time and effort to learn and
> use CW, will be the ones who will fit in best with the people who are
> already there.

What is totally lost in all this noise is the fact that CW
supporters are ALSO digital mode supporters. How is that,
you say? Well, for one thing many CW operagtors are also
digital mode operagtors. And just wait until all the
anticode yakkers flood the voice segments. The very next "I
WANT" rant will be for expanded voice segments at the
expense of the digital/CW segments. No question about it.
When the fone bands are overloaded, there WILL be a movement
downward, and flushed with the success of having just killed
the code requirement, there'll be no holding them back.

If ham radio isn't dead it sure is seriously ill.

Having something shoved down your throat does not foster
> the best attitude, and many may develop an "anti CW" attitude, because
> of all the pain they had to go through to learn something that they have
> no use for.

Unhuh. Just as it alway was. The difference is that those
childish folks you mentioned will NEVER learn what
radiotelegraph as a mode actually is, they will only know
what they percieve as unlearned individuals. Of course,
today that's enough. Decision made.

And just who is it that is shoving ham radio down *anyone's*
throat these days? I think he should be prosecuted.

This could lead to deliberate interference, or lack of
> respect for the users wishing to use CW.
>

Ah, so. Tacit admission that codehaters jam active CW hams,
huh? No surprise, actually, and quite typical. I can't wait
until the codefree HF license invites all the rest of the
27mc heros on down to HF ham radio. THAT is when the ARS can
truly be declared as lifeless, and can be given a pauper's
burial.

Welp, 27 mhz refugee that you are, you might at least make
some attempt at accuracy. If you check the comments sent to
FCC in response to the NPRm you'll see that some 75% of all
writers support REDUCING the cocde test requirements.
Including this "old fossil" writer.

>
>
> >I think I have this straight--they and anyone who supports a continued
> > morse testing element for HF access are wrong.

No I don't think you have this straight at all. I don't
see anything to indicate that you/ve ever had ANYTHING
straight. Your qualification to make ANY statement about
amateur radio licensing is nonexistant.

There are 2 distinct and different groups: *pro-CW* and *Pro-code-test*.

I am pro-CW and support *no* code test. There are many like me. Also there are many pro-CW operators who *do* support keeping the code test. If you're going to play the game you need to understand the players...

(And then there are the pro-CW operators who are *politically correct* and wish the code test reduced to 5 wpm, but not eliminated, right Ed??)

From my dictionary:
Aesthetic: relating to beauty.
Fun: something providing enjoyment.

Actually I didn't disagree with your word "aesthetic. I said that *I* would have used the word "fun" (because that's the way I perceive CW). But your word is also appropriate. Many of us do wax nostalgic about the grand old mode, as you would a beautiful piece of antique radio gear...

Really? Prove your statement.

It's the old fossils at the ARRL, and other "Keep CW at all
> costs" groups that are fighting the trend.

False premise. The Board of directors and staff of the ARRL are old
fossils? They are in full agreement on keeping CW testing? Prove your
statement.

> >I think I have this straight--they and anyone who supports a continued

A "modern" reason? What, pray tell, is a "modern" reason? Because YOU
or others choose to DISLIKE learning morse is no reason to change the
rules or to expect the rest of us to dislike morse testing or CW use.

> CW is a MODE, like SSB, AM, FM, SSTV, AMTOR, PACTOR, PACKET, FSTV, RTTY,
> QPSK, etc, are modes. There are no special testing dedicated to any of
> these modes, so why should CW be any different?

Because a machine does all of the encoding/decoding for you in the
digital modes mentioned. None of those digital modes approach the

widespread use of CW. The voice modes aren't tested because an ability
to speak is assumed. Those who can't speak aren't likely to tie up
large hunks of spectrum using the voice modes.

> Maybe we should still require testing on the care and feeding of horses,
> when we take our driver's test......

You can start a campaign if you like.

CW is certainly more than a mode with nostalgia value. Many use it half of their operating time. Many others operate no other mode. We are, at least those of us who continue to breath, going into the 21st Century regardless of the outcome of the morse testing debate. Entering a new century does not call for us to change everything we do or to put on our Star Trek outfits and prepare to journey to the Mother Ship.

Recall that one wave length of transmission line is given by the expression:
984*1/freq. = wavelength

However this is not a true wave length for all transmission line. The above formula must be modified by the velocity factor VF in order to get the correct length. The new formula is: 984 (VF/freq.) = wave length.

You may ask what is this Velocity Factor: Hear is the answer. The speed of the signal in a transmission line is slower the a radio signal in free space. This leads to the velocity factor F (I call it VF not to be confused with Freq..) which is the ratio of the transmission in the transmission line VL and the transmission speed in free space VS.
This will give use VF = VL / VS. This number will vary from 0.6- 0.8

> Does any one know if a HF Henry Radio Tempo one Transceiver is a good
> talking am radio? Is it a tube radio?

I have one...it's not the best. I wouldn't recommend it except on SSB. It will talk AM, but doesn't sound very good.

Please note Before you jump up and down that the formula Klhokanson gave and the One I gave will come up with the same results. His formula is for a half wave length or wave length/2. As mine is for a full wave length or half wave length * 2.

I find my may easier to punch into the calculator.

>as a mode of operation this would make an excellent Classic
>CW rig... wouldn't you agree?

Totally. Just wondering. Usually people get a receiver so they can
listen to all those bands and modes they plan to eventually operate on.
You seem to be exclusively interested in only the transmitter.

If you plan on working CW, the Viking is a poor choice. It doesn't
have the WARC bands. QSY's will be laborious. Frequency
stability will be less than optimal. Plus, you will be limited by the
quality of the receiver you pair it with (selectivity, filtering,
tuning accuracy, etc).

A good, used, 80's era transceiver would be a better all around
choice for a new ham. You'll get digital accuracy, all band coverage,
noise reduction and other conveniences you'll appreciate when on
the air.

The Viking is a fine classic rig. But except as a CW nostalgia station
(or eventual 75 meter AM driver) it hasn't much practicality to offer
the new Tech (or Tech Plus) ham.

Message-ID: <3839b2d9.1434213@news.gate.net>
Source record: 12377

On Thu, 18 Nov 1999 22:15:27 GMT, MC 10kW Jesus <qsl27@hotmail.com> wrote:

*If I may expand on the impedance ratios a little as this is an area of great
*confusion.....:->
*
*A balun is a transformer. That's probably why they are called "balun
*transformers". Just like any transformer there is a voltage ratio. This is
equal
*to the turns ratio of the transformer. So, if you had 1 turn going in (primary)
*and 1 turn coming out (secondary), the voltage ratio would be 1:1 If you added
*another turn to the secondary the voltage ratio would be 1:2. However, the
*impedance ratio is the square of the windings so it would be = 1^2 : 2^2, or
1:4,
*usually referred to as "Four to One". This is ultra-important if you are
*experimenting with these devils. You'd be amazed at how much power you can
safely
*pump through a very small toroidal balun.
*
*MC
**8

A balun is an impedance transformatoin device. Impedance transformation can be
accomplished by means other than a simple transformer. A quarter wave length of
coax will due a 4:1 impedance transformation, yet therre are no primary or
secondary windings.
Baluns are in two variety, voltage and current. A typical current balun is 20 to
25 type 43 material ferrites beads over the coax at the feed point. This wil
give you a 1:1 impedance balun.

The main purpose of a balun is to balun currents in the antenna, thus preventing
the coax from radiating from the outer shield.

I ran across a person who has a Tram B201A 40 channel rig.
I`m not sure if this is the right catalog number,but it is 40 channel.
The rig looks like it has been in a glass case and no one ever touched it.
It also has an amplified D104 microphone with it.
I was trying not to look stupid while I was looking at it(hard to do) and not
asking very many questions.
The owner was asking $250.00 for the rig with the microphone included.
Is this a good buy ???
He told me I could try it b-4 I bought it.
Damn thing is impressive looking.
Should I buy it or not ??????
Thanx for your help !!!!

: Thanks

Not nearly as good as a well built receiver and some filters in the coax
line if your in a busy RF area.
Pick up an ARRL Handbook and make up some from scratch.

For those that didnt read my first post, I ask"whats the cleanest radio out there. not just clean sounding but clean as far as harmonics,bleedover, etc".
Ok I havent herd any disputes that collins is not the cleanest radio around on the air. My next question is which Collins? S Series, KWM-2 ?
Also is there a military model Collins radio that measure up to these two.
Whats your input?

KRS

You read the post wrong!

And besides how well do you know the names in the list?
How well do you know me?
How well do I know you?

I am not subscribing to your negative response to a positive fellowship with those whom I talked to.

And besides, if you don' t like my post, take your attitude to another "channel" or another newsgroup.
It's simple-> change it, turn it off, or accept it!!

Handy Andy or "Mr. CB" needs to chill and think about responding to posts that do not refer or pertain to him/her.

I read the post by "The CBer formerly known as Stealth Rider" (cool title)

And my views are very different.

His post was to let the others know that just because he is not on CB anymore -doesn't mean that he doesn't talk to them again.

And you need to look for your name in someone else's list -not his.

I believe that someone may have you on their list for bad-mouthing them and you [Handy "Mr. CB" Andy"] need to indeed grow up.

Making threats that if you saw your name on his list that you were gonna chew his emotional butt really do sound threatening. NOT!!

Also you need to go back to school and get a DECENT EDUCATION instead of listening to trash like yourself "dick-tasting" to others
about CB and how one is supposed to keep the fact to themself about having a ham license.

I saw a post that someone entitled "Handy Andy Is A True American"

FALSE!!

Nevertheless, YOU are A True Communist!!

You need to weigh the information and diversify with your "CB Nazi"-type attitude and Look at the BIG PICTURE!!
Yeah, Yeah -I know that you are probably going to be ready to type another useless "CB State of the Stupid" speech after reading
the truth about Human existence and how America will Walk all over your Nazi-buddies on CB. Take a listen to "These Boots Are Made For Walkin'" and you and your CB-nazi buddies will be the subject of this song!!

America will not tolerate nor accept Communism as a way of life!

"So, Get Back! Get Back! Get Back To Where You Once Belonged!"

After reading your commentary response that was directed towards the other individual, I need to point to you a list of things to consider.

A> When you respond to a post, check your judgement towards the subject. DO make sure that it does NOT refer to YOU!
B> Respond to a post the way that YOU would want to have OTHERS who respond to YOUR posts!
C> Never instigate a posted message into a large-scale media event that WILL eventually come back on YOU!!
D> Make sure that YOU are NOT on someone else's list before you "chew them out"
E> Smile when YOU talk to others
F> Don't evend Respond to the post at all! YOU save yourself the humiliation and embarassment.
G> Accept the truth that YOU have just been humiliated and embarassed by "The CBer formerly known as "Stealth Rider"
H> Change your underwear the next time you attempt another stunt.
I> Accept the fact that other people use this newsgroup -NOT just YOURSELF.
J> Accept the only true knowledge of knowing you know nothing. (refer to the philosopher: Socrates)
K> Accept the truth that You Make Mistakes.
L> Learn
M>Never Assume - it makes an Ass out of yoU and ME!
N>Make sure that YOU are happy and content!
O>Just because someone has a Ham License doesn't mean that YOU should never have one!
P>Just because YOU know about CB doesn't mean to push your "religious beliefs unto them"
Q>There are other people who live on this Earth! Believe It Or Not!
R>There are things to not sweat yourself over besides CB and HAM!
S>ACCEPT
T>Believe that YOU are ONE!
U> Feed The Rush!
V> Accept A Reality Check!
W> Check Out Reality!
X> Don' t Change Others!
Y> Give Thanks For ALL Things
Z> We are Born at point A and we will die at point B -----Live Your Life To The Fullest! !

From A to Z!! Consider these, and you will never be a "Lonely CBer, again"

Now, what was that talk about telling others to what to do?
How is it that a person like yourself can't understand HAM radio?

I read the posts and was appalled at your reputation!
I thought you were a "True American" , Handy Andy aka "Mr. CB"
Nevertheless you are a True Communist posing as a "True American"!

3972. Handy Andy is NOW, "Mr. CB-ASS" was Enjoyed The Fellowship

Newsgroup: rec.radio.cb
Date: 1999-11-23 00:00:00 UTC

Congratulations on becoming Mr. CB-ASS!!

Your title of "True American" has been given to "The CBer Formerly Known As "Stealth Rider"

After reading your posts and watching your weak attempts at cutting others down just because they were saying a farewell to those they know on CB.
You instigated the post and turned it into a repeat offender!

HOW DARE YOU!

Others use this newsgroup!

How about doing the same and Cease all Nazi-type activity or face prosecution for being a True Communist!

3973. Re: AMATEUR RADIO OPERATORS(Second posting)

Hmmmm....so if I put my 50 Ohm antenna on a quarter wave of 50 Ohm coax I will have 12.5 Ohms at the radio? :->

> The main purpose of a balun is to balun currents in the antenna, thus preventing
> the coax from radiating from the outer shield.

Agreed. A balanced to unbalanced transistion.

3976. What is Range of 4W Handheld CB?

Newsgroup: rec.radio.cb
Date: 1999-11-23 00:00:00 UTC
From: Frog@mageos.com
Message-ID: <19991123010810.777.HaLoPa@nyarlatheotep.frog.org>
Source record: 12261
Cross-posted to: rec.radio.cb,misc.survivalism

I recently picked up a 4W GE handheld CB on sale for possible emergency communications use. I have no previous experience with this particular form of radio communications, though have extensively used other systems and frequencies.

I see a radio seller's page that gives the unit a range of "100 feet to 100 yards +" which seems incredibly short for 4 watts, even with a short handheld antenna. I mean, why bother? I can _yell_ better than that.

Is that range estimate in error? What is a _typical_ maximum useful range for a 4W handheld CB? I don't have anyone to test this out with, so I'm relying on the accumulated experience of users here.

Thanks for any help.

3977. Re: Coax Length Calculation

Newsgroup: rec.radio.cb
Date: 1999-11-23 00:00:00 UTC

234/f = length of a quarter wave stick

300/f = wavelength; divide this by four to get your quarter wave (length in metres)

f = frequency in MHz

Don't forget that the actual quarter wave stick will be slightly less than a true 1/4 wavelength. This is to cancel the reactance such that it will provide a resistive load to your transmitter. In the case of a quarter wave sitting on the ground, this is 37.5 Ohms. Sitting atop a metal cone with sides 135 degress, it will be 50 Ohms (starduster). A coaxial dipole, basically one ground plane angled 180 degrees down (big stick) and you get 75 Ohms.

Can ya' digit?
MC

3978. WTB: your older handheld-type LED calculator

Newsgroup: rec.radio.cb
Date: 1999-11-23 00:00:00 UTC
From: floete@aol.com
Message-ID: <19991122191432.10585.00000755@ng-xb1.aol.com>
Source record: 12263

I'm looking to buy older handheld-type, battery-operated calculators, mostly looking for the LED-type (or Nixie tube) calcs from the 1970s, the ones with the reddish, blackish screens, often with glowing red numbers, as opposed to those you see most often today, with their typically grayish LCD screens (except for HPs -- love em w/ any screen!). I'm looking for all makes, all models (and LED watches, too, if you have one), as long as they work well and are cosmetically clean -- see partial list below. (The only calcs I don't want are those made by Texas Instruments.) Anyway, if you've got the old manuals, cases, chargers, so much the better. Just drop me an email (floete@aol.com) and let me know what you have and the condition it's in, and what you might want for it, if you know.
Thanks!

Calcs I'm interested in include, but are not limitted to those made by: Hewlett Packard (all models, both LED and LCD), Adler, American, Apollo, Aries, Aristo, Brother, Busicom, Caltronic, Candle, Citizen, Colex, Columbia, Corvus, Crown, Dataking, Decimo, Dictaphone, Digicomp, Dixon, Edmund, Enterprex, Facit, General, GIC, Hanimex, Hermes, Iain Jones, Ibico, JC Penneys, Kingspoint, Litton, Logitech, MBO, MITS, Master, Melcor, Mintron, Monroe, Omron, Ordibel, Panasonic, Pico, Pye, Ragen, RBM, Regan, RFT, Ricoh, Royal, Samsung, Sanyo, Sinclair, Spectrum, Sperry, Summit, TKS, Toshiba, Universal Data, Verax, Victor.
Good golly -- can you believe there were once about 220 brand-names in all?

3979. Re: Is this a good deal for a Tram ????

It sounds like an okay deal. I wouldn't pay more than 200 spondolies myself though - and this is assuming it is bone stock. Try it out. It's an old radio and will have all the problems that go along with that. If it is nostalgia you want, it'll give it to you.

MC

3980. Re: Coax Length Calculation

Newsgroup: rec.radio.cb
Date: 1999-11-23 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <3839deb3.213340279@news.iserv.net>
Source record: 12265

Greetings!

You answered your own question, yes, it works well.

You *derate* it by the Velocity Factor of the coax.

Typical RG-58 - or RG-8/U use .66 or 66%.

Typical RG-8Xmini - is .80 or 80%.

But the values you're suggesting are rated for 66%.

If you use RG-8Xmini, you'll find it works, but you might not have
enough length, it's shorter than what you need. So, don't forget to
use VF of .80.

With any other type of coax, the VF may not always be available for
it. So do a best guess, but I haven't seen any coax with a VF of 105%
or something like that...;-)

Interesting topic!

While Dancing with the Mouse on 22 Nov 1999 06:43:03 GMT, the Modem
interrupted with an MNI from "klhokanson@aol.com (KLHOKANSON)", and
the MotherBoard buffered this to Video RAM:

Amen, brutha! In my vast experience in repairing CB radios of every shape, size, color and land of origin, the 'technicians' that aren't willing to share their knowledge are typically the ones that have the least amount of it. If you continue to learn as you work you will always be ahead of your competition regardless of how much you tell them. Of course, a fortune can be made from others' mistakes - and this IS good business!

Source record: 12267

Greetings!

You did fine, I've seen 77-115's cheaper, but only on the internet.

Don't give it too many bumps!

As far as antennas?

What part of the roof is fiberglass, all of it or just towards the
rear past the center pillar?

A mag mount near the front of the roof is better than trying to run a
dual antenna set-up - you get directional when mounted in an ideal
spot, but having if off the mirrors right by the window pillars is
shooting yourself in the foot for performance.

What other choices we're you looking into?

While Dancing with the Mouse on Mon, 22 Nov 1999 00:50:41 -0600 (CST),

I'm a big fan of speech compression and processing.It will increase your "talk power" and make your signal easier to copy - particularly if your signal is weak or the conditions are noisy. Of course if you run them too loud they'll actually decrease your signal's intelligibility.

Dig

Greetings!

It sounds like whomever worked on it first, doesn't want to help you.

And I'm sure that by what you're describing, there are far bigger
problems to solve once the "mods" have been undone.

This is what makes it difficult for others to provide help.

We know you're new, I don't have a problem with this. Others, as
posted, do have a bit of a time trying to help when there is very
little information to go on.

Saturn is from Galaxy, I suggest you start there. There are too many
problems just from what I've read, to offer any direction except to
bring the radio in to Galaxy and have them, *ulp*, rebuild it.

The 10Kc switch, sounds like a real problem. Same channel? It may be
jumpered wrong.

Other things would be too involved.

I'm sorry to see that we can't help, but hopefully Galaxy can.

Thats an old myth- you need gold plated PL-259 connectors to increase your transmit range by 500 miles. A silver plated loading coil on your antenna is worth a thousand miles! It helps launch the RF off the antenna using the mostly mis-understood coilspring effect.

Good ground plane! 8-)

> My tests show about 6 miles.

> Just go to rad shack and show them the handheld and they'll set you up
with the necessary
>connectors. (don't spend more than 30-35 bucks on the whole setup.)

Not when I spent $30 on the rig. 8-) Car emergency CBs with the longer mag-mount antennas show up on sale for around $35, so that would probably be more economic, plus it would have the advantage of being presumably SWR-pretuned for the supplied antenna.

Speaking of which, someone once told me that with a little junkbox circuitry you could do SWR tuning with a multimeter. True?

It might be fun to build a base antenna for it, just as an experiment and to put some of my garage trove of coax and connectors to use.

Thanks for the input!

Well if you use a capacitance hat on an antenna with a silverplated loading coil it dampens the coilspring effect and cancels out any RF launching effect. Them CB guys just like the look of the hat! Now on the other hand those neon bulbs that light up really enhance the signal range. They step the 27MHZ signal up into the .4 nanometer band (the wavelentgh of orange light) and launch the signal at 3 times the speed of light. When combined with the silverplated loading coil spring rate of 27185000 cycles it gives you about 20DB gain over a trashcan lid! Now thats gettin out!

Ya' know, you could replace your 'scope, rf sig gen, freq counter, two-tone audio gen, function gen and dummy load with one ten-year-old IFR1200. That way you would only have to calibrate one piece of equipment each year. You -do- calibrate all of your instruments annually, right?. Hmmm...that doesn't look like an ESD workstation... 21 years? I think I'll do my own radios thanks...

Ooooh for Christ sakes John get the hell off your High horse, or soap box, or what ever.
Maybe,
JUST MAYBE, the words didn't get typed out correctly. But from a stand point of him beeing
new
to the radio he might of heard his uncle bleeding over his radio, and stephen might of

talked
through his mike on his computer asking his uncle if he could hear him. At that exact same time,
his uncle talking to someone on the radio a, responded with the word "yes" and stephen interpeted it as his uncle aswering him back. Not far fetched consisering I have heard two stations having a conversation, and a local will try to cut into the qso and start thinking they
are talking to him, when in actuality they are not. You sit here and argue with stephen just to
try to make yourself feel smart, and look as if you are smart to other people on this newsgroup.
All you are acomplishing is making an ass of yourself. Now that I'm done with you.

Hank the only thing that people need to know is that DTI's program I believe only works with
pll's that are BCD PLL's for the channel selction. But I could be wrong I havent tried the program.

You're lookin' at about 5 miles on the open road on a clear day. If you picked up this radio strictly for emergencies, don't be disappointed if you can't raise anyone when you need help the most. Also, don't be too shocked at what comes to your aid! Myself, I wouldn't rely on CB for an emergency any more than I'd rely on ten year old condoms for safe sex.....

Ribbit

HOLY HOLIER THEN THOU HAM, BAT MAN... Just because I posted in a CB related news group doesn't necessarily mean that it will be used for that purpose. I'm sure there are some people here that are as well versed in electronic theory as in HAM related news groups. I posted there as well and was also aided with the questions that I posed. In fact I post there from time to time, just a couple of weeks ago I posted "I would so like to be a ham sam I am" and other ham related subjects. Also, I don't remember you posting any helpful replies to my queries, however you DO seem quick to jump to conclusions and point your self righteous finger and condemn me for simply wanting an older transmitter. Is this what being a ham is about? I believe your peers would disagree. What happened to ham radio being a tool to promote good will amongst nations and people?

Thanks as always for you opinion,
john

<< I don't remember you posting any helpful replies to my queries,
however you DO seem quick to jump to conclusions and point your self
righteous finger and condemn me for simply wanting an older transmitter.
Is this what being a ham is about?>>

Wrong. I advised you of some pros and cons of starting out your ham career with

a Viking II tube transmitter....versus a 1980's-era Japanese transceiver.
You're
perfectly free to ignore or use my info as you see fit. No condemnations given
or intended.

Likewise, why you seek advice and information about a ham transmitter
that you intend to operate in the ham bands from rec.radio.cb rather than,
for example, the boatanchors newsgroup (specifically dedicated to discussion
of vintage tube ham gear) or rec.radio.amateur.equipment (specifically
dedicated to discussion of general ham gear) is certainly none of my business.

> the new Tech (or Tech Plus) ham.

<>

I can't agree more with your appreciation of vintage gear,
be it electronic, or any other kind.

The Viking II is a beautifully built transmitter with a pair of 6146's
in the final RF amplifier modulated by a pair of 807's. It operates on
160-10 meters at a DC input of 180 watts CW and 135 watts AM phone.
The Johnson VFO was designed to match this transmitter as well as its
predecessor, the VIking I. As far as I know, this VFO does not cover the
WARC bands (24 MHz, 18MHz, 10MHz).

Johnson didn't make a matching receiver. Most hams paired up the Viking with a suitable tube receiver of the same era; Hammarlund, Hallicrafters, Collins, Drake, etc. These rcvrs have mute circuits and can transceive with xmtrs such as the Viking when a Dow-Key, Johnson, or other type of coaxial relay is used.

My point was that, while this kind of "nostalgia station" has great appeal, you

will be very limited as to what you can do with it. If this is your only "rig", you'll
be missing out on many of the modes and bands that your future ham radio ticket

can offer you.

You aren't going to get much range with a handheld and much depends on how you are going to use it. If you are using it around the farm, and the radio on the other end is a base station with a good antenna, you can go out seven or eight miles fairly reliably, and probably talk with most of the adjoining farms.

The city is a little more difficult. Just a few blocks with a handheld. Again, if you are walking a neighborhood watch and there is also a base station nearby, it will probably have enough range, but if you want to talk across town, it isn't going to be of much use.

The CB frequency is subject to noise from sunspots, so night communications will get you further because there is less background noise. You won't work any "skip" with a handheld, but skip probably wouldn't be much use to you in most emergencies that you are likely to face anyway.

A lot of cars and trucks have CB's ... and it can be a backup if you are traveling. You will have to be in sight of the other vehicle that you are trying to flag down, but at least you can convey the type of help you need.

There isn't one radio setup that is ideal for all situations, and if you have the bucks, have a CB in each vehicle and one set up in the home. A few FRS handhelds would be nice ... and perhaps a no-code ham license and station as well as a cell phone to round and short wave receiver to round things out.

A handheld as a regular radio is probably the worst possible solution to all but close in communications in my view, but still better than none.

The entire no-code debate is about the code testing requirement, not
elimination of the use of CW. So, obviously the comment above was a
comment about the pro-CW testing group. Therefore, Mr. Jones, I do know
the players. However, thank you for your comments.

Radio Shack sells several mirror-mount antennas. A new one (21-804),
which looks a lot like several of the Wilson antennas, may be just what
you're looking for.

Or, you may want to go with the standard twin 102 inch whips on the
back bumper (also available at Radio Shack).

The MFJ-815B does not need 12v power for SWR or RF power readings.
The 12v power is only required for the meter lamp.

By the way, you can obtain another manual from MFJ (www.mfjenterprises.com).

It IS a nice antenna. You should be more omni-directional now... Also, if you wanted to try another "remedy," I would take about two ground straps from the trunk lid to the other part(s) of the car to provide a better ground on the trunk. This would also create a front directional..... (eg most of your signal would go forward)

There is an optional whip for the wilson antenna's. 1000, 5000 and it will
work on the k40 as well. It is the wilson short whip. It's about 3 foot long
or so with a load close to the base. Maybe that will help on the lengh of the
stinger.

Here is a new idea for this string. Buy your own tune up manual. That way you will have the information and will have paid for it. Then if you choose to give it away free, then that is your option. That wasn't so hard and may have already been answered in this manner.

No need to get mad at a Man or Woman who doesn't want to give their livelyhood away. Thats what pays their bills. Believe it or not some people on these news groups actually use some information recieved out of a string to repair radios. Thats ok too. Your local tech will be pleased with the added workload to fix the mistakes. Or tell them they have trashed a perfectly good radio. The information is for sale, so order the manual.

Have a happy holiday. God Bless you.

Yes.

Cetron, Penta and a couple other brands still do exist (although they are
Chinese made tubes, and do not usually come with any or a decent warrantee).

Svetlana recommends putting the 572b in boxes using the 811A. It works
well, has more dissipation and can handle more plate volts / grid drive.

Better all around tube, although it does cost about 50 percent more.
However, barring equipment malfunction, it will last forever.

Probably more accurate would be "100yards to 1000 miles." The typical Citizen's Band transceiver uses an AM (amplitude modulated) signal, which is very inefficient, requires a lot of power, and receives 60-cycle and electronic noise as loud static. Under optimal, quiet conditions, a "barefoot" CB'er with a stock 27 Mhz radio might talk clearly to another station 1200 miles away -- I've done it many times, usually very early in the morning. The flipside is that we today have many times more electrical noise running through our atmosphere than when CB was established. CB in the city is usually a lot of squeals, squawks, and noise with a little signal and even less range.
An advantage is that CB radios are dirt cheap, and there are thousands of regulars on the air at any given moment. This alone makes it worthwhile to have at least a mobile CB. Personally, I prefer a radio that can also use the SSB (single sideband) mode, because those allow 12 watts with a much better and quieter signal, and long-distance "skip" is more reliable.

And who elected you the judge of whether or not *I* know what I'm talking about? Maybe if *YOU* knew what you were talking about and listened to this issue from the roots of the common people that have to deal with it, you'd get the feedback that I did.

Comments filed on behalf of the NPRM only reflect a very small segment of the ham population, and cannot be considered as "the voice" for the hobby in general.

And many others aren't so what's your point?

Besides, what does that have to do with anything? Nobody is talking about eliminating THE CW MODE, only the mandatory testing of it.

> And just wait until all the
> anticode yakkers flood the voice segments. The very next "I
> WANT" rant will be for expanded voice segments at the
> expense of the digital/CW segments. No question about it.

Your paranoia is typical of the "pro code" side. This fear paranoia, that they will lose their precious CW band segments to "other" modes, is what keeps them focussed on preserving the CW test at all costs, and blinds them to any rational thought in regard to this subject.

> When the fone bands are overloaded, there WILL be a movement
> downward, and flushed with the success of having just killed
> the code requirement, there'll be no holding them back.

I don't consider opening up VOICE modes to be a bad thing. When was the last time that ham radio has made any significant contribution in the communications field? Maybe if we can open up new band segments for digital voice or spread spectrum, maybe we can at least keep up with the commercial sector.

> If ham radio isn't dead it sure is seriously ill.

Agreed. And holding on to ancient modes, and the testing for them, is what's killing it.

>
> Having something shoved down your throat does not foster

Why should ANYONE need to learn the CW mode? Why? Would someone please tell me? What relevance does it have TODAY? It's one thing if you are into history (or if you are history ;)) and want to relive some nostalgic walk down memory lane (And you can trash your ICOM 781 for some old 2 tube beauty as well). And if you want that extra few miles that the reduced bandwidth can get you when working DX, then fine, it's YOUR CHOICE. But it shouldn't have to be EVERYONE'S choice.

> burial.

Surprize! Do you want to know the REAL reason why CBers aren't flocking to the ham bands in droves? HINT: It's not the code test.

The real reason is that CBers consider hams to be stuffy, arrogant, cliquish, standoffish, generally unhelpful, and egotistical (With some exceptions).

This very topic has just been extensively hashed out on rec.radio.cb, and a dejanews search should be enough to back this up.

I would think, with the recent publicity of the ranting on 75 meters (of all genrals and higher class, who had to learn the code) by people with less than ideal moral character, that you would have enough to worry about without that old "The CBers are going to get us" paranoia.

Evidently the commercial sector disagrees, as they have all discontinued
regular CW usage. Only ham radio dogmatically continues to emphasize CW.

> Many use it half of their operating time. Many others operate no other mode.

And many never use it at all (myself included), so what's your point?

No, but in case you are too blinded by your passion for CW, that you
fail to notice that Ham radio has become stagnant. There have been no
new technological breakthroughs. We live and function at the whim of
Icom, Kenwood, and Yaesu, and other companies capitalizing on the lazy
appliance operator that seems to take up most of ham radio, today. Soon
it won't be CW that we are argueing with the FCC over keeping, it will
be defending the ham radio service itself, to an FCC under increasing
pressure for more frequencies, from commercial sector users, to develop
even more digital widgets, so that we can do E-mail from the toilet and
such.

If we don't grow as a service, we will wither and die. The old
"providing emergency communications" arguement is slowly losing clout.
With cellular and other radio services becoming more reliable, and
convienient, there may not be a real reason to keep ham radio, for that
purpose. And since we now lag, rather than lead the communications
field, we certainly are not the "sandbox for radio development" anymore.

How's that for doom and gloom? Think about it.

Ad Hominem comments do nothing to bolster your credibility in any form of debate, so you would be wise to avoid them. Stick to the topic. If you were more observant, you would see that I am a licensed ham as well as CB radio user. In fact, I don't consider myself a member of any group. I am a "Radio Hobbiest". I play with whatever radio bands are available to me. I don't look down from my holy perch of hamdom to other radio users. I interact with them.

> If you check the comments sent to
> FCC in response to the NPRm you'll see that some 75% of all

NOW they do, now that someone has finally seen the writing on the wall. That and the fact that the "oldest" fossils are finally dieing off, and being replaced with younger, more forward thinking people, has a lot to do with it. Each time this issue comes up, there is less and less resistance to it. The last time, the FCC proposed the no code VHF license, and it was shot down by the ARRL Fossils, the result was the loss of the lower part of 220 Mhz. So guess what, the next time the FCC said "no code"?, the ARRL reluctantly agreed (Lest they lose even more bands). It's no different now. Adopt newer licensing guidlines, or risk further slicing up of the bands.

And your ability to determine who you are responding to, leaves even
more to be desired. That was not my statement, but the guy that *I* was
responding to. And again, you have no authority, or right to make any
judgement calls regarding *MY* qualifications. What you THINK about me
is irrelevant. Your attempts to deflect the issues into a personal
namecalling match will fail.

I never post anonymously. I have nothing to hide. But I don't go proudly
attaching each and every meaningless title or club affiliation to the
body of my text.

I will have to eat a bit of crow though. Since this thread became
crossposted to rec.radio.cb, the users there, have had a chance to see
what "real" hams are really like. Just after I got done defending ham
radio and many of the operators that I know, in my circles, guys like

you come on here with ad hominem attacks, unjustified condescending comments, and general jungemental namecalling, without any facts to back it up. You've just gone and erased all of the good feeling about ham radio that I've tried to bring to these guys and reenforced their initial beliefs that hams are egotistical, arrogant, condescending, unfriendly, and unhelpful.

Thanks alot pal.....

The record of resistance that the ARRL has had to FCC "suggestions"
concerning "modernizing" ham radio have been well documented. When the
idea of a code-free VHF license was bandied about not too long after
"novice enhancement" (remember that?), the ARRL shot it down, and then,
right after that, the FCC took 220 - 222 Mhz, from us, and gave it to
UPS, who really didn't want it, and are not really using it today. This
was the FCC telling us, in no uncertain terms, that we'd better wise up,
or lose out. So the ARRL all of a sudden "recommended" a no-code
license, and it passed. Coincidence? I don't think so.

Why not? It's no different than you dogmatically sticking to an outdated requirement that CW must be learned.

A "modern" reason. Ok, with the advances in communications technology (Which was developed outside of ham radio while hams relaxed in their easy chairs working some rock in the middle of the ocean), it is no longer necessary to use CW, in all but the absolute extreme conditions. Since there is little that CW can give you over other digital modes or voice, and that there are so many modes that a prospective ham may choose, it is no longer necessary to know morse to operate a ham radio (This is not the 1920's). Note that the key word is "necessary". What you CHOOSE to do, is your own business. But it's not right that a few dogmatic people make that choice for everyone. If you love CW, then GO FOR IT! Use it, have a ball! But don't tell a prospective ham, that in order to play with their latest digital QPSK or QAM project, on the air, that they have to learn an archaic telegraphy skill first.

This stubborn dogma is what's killing ham radio. If we can't let go of the past and move forward, then we will wither and die. Some of you guys that have maybe another 5 or 10 years left before you are pushing up daisies, can sit blissfully happy working CW, just like you did 50 years ago. But alot of us would like to have ham radio as a hobby, 50 years from now. But to do that, we have to move with the times.

No one is suggesting that the usage of CW be discontinued, only the requirement for having to know it, to be changed. It makes little sense, for people desiring HF VOICE or DIGITAL privileges, to have to demonstrate CW proficiency. Keep the CW test for privileges on the CW bands only. At least it's related to the mode that you desire. Would it make sense to you to be required to know how to swim, in order to qualify to ride a motorcycle?

If you're thinking of 11 meters, then you may as well tear-up that ham license of yours - the new enforcement environment guarantees you'll loose it if you get caught on 11 meters with it.

It is true that you did point out the weaknesses of the transmitter and overall lay out of the rig that I would like. This won't be my only radio, but will be my preferred rig for the modes and bands its capable of. This will cost more, but it is a hobby and not meant to be cost effective. The reason I chose this transmitter is that I already own one, in less then ideal cosmetic shape, and another was made available.

> or intended.

I could be wrong but if I remember correctly "Thanks. I think we've pretty much figured out what band and mode this particular Viking II is going to be used on." implying that the radio I was looking at was to be used for AM transmissions in the CB band, in a court law the conclusions which I draw from your statement wouldn't stand. However this isn't a court of law so lets be truthful with each other and not play word games.

>
>
> Likewise, why you seek advice and information about a ham transmitter
> that you intend to operate in the ham bands from rec.radio.cb rather than,
> for example, the boatanchors newsgroup (specifically dedicated to discussion
> of vintage tube ham gear) or rec.radio.amateur.equipment (specifically
> dedicated to discussion of general ham gear) is certainly none of my business.

As I have said, I have posted there also, and have received alot of help and info to the questions I've posted. As to why I posted here, obviously there are people in this news group that have experience with these transmitters, and to dismiss these people and their info just because they may not have a ham ticket would be awfully foolish of me. Information in itself is not inherently bad, what a person does with said knowledge is an other matter.

Regards,
john

4058. Searchable Database with SSB Operator Callsigns

Newsgroup: rec.radio.cb
Date: 1999-11-23 00:00:00 UTC
From: hingram@amel.tds.net
Message-ID: <383aa91d.83429643@news.tds.net>
Source record: 12443

I have seen Buckmaster with their database for Amateur Radio Callsigns for the US/International

How about a database that has the Callsigns of SSB Operators either operating in the 40 channels or "Freebanders" for QSLing them.
I have heard a few stations above 27.405 MHz AM/SSB operating SSB either Lower Or Upper Sideband.

Sounds like a good idea for someone like myself who would like to QSL a SSB station that I heard on shortwave above 27.405 MHz

Does such a database even exist yet that allows users to search for a 27 MHz SSB station the same
way the HAM CALL Databases do?

Sean

Computer companies didn't intentionally create this problem to
make more bucks and I don't think saying programmers where
short sighted is true either. Back in the day, when most of this problem code

was written (60s-70s), disk and memory space was expensive and very hard
to come by. Programmers had to save space anyway they could
(both disk and RAM)...so they could cut out 2 digits from every record
they had (from the year field) - and in most cases this saved them tremendous
space.

Any computer system that is super important - is already fixed. People
are making a buck off the hype more than anything else.

Bob.

Indeed! First you say that *I* am paranoid for beleiving
that yakkers will insist on invading the digital/CW
segments, then you prove my point by saying you're in favor
of just that! Thanks for your support!

When was the
> last time that ham radio has made any significant contribution in the

Typical no-coder rant. IF you really believe it, it just
shows how far out of touch with reality you actually are.
But since its just more of a No-code Agenda, it doesn't
count,of course.

> > If ham radio isn't dead it sure is seriously ill.

No, pal, it *IS* the code test, period. The FCC knows it,
too. aLL your bluster and bluff is for naught. The old heads
at FCC remember it all too well. It's currentlyu the ONLY
thing holding all your buddies back. You know it, only too
well yourself. Hence the strong effort to trash the code
requirement, en total.

>
> The real reason is that CBers consider hams to be stuffy, arrogant,

Psst! I hope you'll not take this as an ad hominem attack:

It is "radio hobbyist". It is also interesting to note that you
advocate doing away with morse testing so that others can "play with
whatever radio bands are available". Is that the advancement you've
talked about?

Are you now or do you contemplate becoming a commercial operator? I
don't believe your comments have any bearing in a discussion of amateur
radio licensing. Morse code useage among hams is quite commonplace.

> > Many use it half of their operating time. Many others operate no other mode.
>
> And many never use it at all (myself included), so what's your point?

The point is that CW is a mode in widespread use. That, if nothing
else, is a reason we test for it. The point is that you mention CW as
if nostalgia value is the only value it has now. The point is that you
are incorrect.

> > We are, at least those of us who continue to breath, going into the 21st Century

I'm not "blinded" anymore than I "live at the whim of" any manufacturer
of amateur gear. You can e-mail from the toilet now if you like.

> If we don't grow as a service, we will wither and die. The old

> field, we certainly are not the "sandbox for radio development" anymore.

If cell sites can't link to the non-cell telephone system, as might
happen during a widespread weather emergency, there'd be little
likelihood of communicating via that mode.

Hams haven't been in the forefront of radio development for decades
unless you count engineers who happen to be hams.

> How's that for doom and gloom? Think about it.

Okay, I've thought about it. I still don't think you have a handle on
what is likely to happen or why we test for CW. Just out of curiousity,
how long have you been involved in amateur radio?

This IS getting tiresome. We did this a few posts back. Morse code is
a widely used mode. That's why ANYONE should learn it. Now, someone
has told you (again). It is not a nostalgic walk down memory lane;
morse is in use today--now--this minute.

Collins equipment is over priced tube equipment from the 60's. The designs for the S-line and the KWM-2 line are both over 30 yrs old. They were designed for military and amature use. They are tunalble to the CB band. My opinion they are extremely over priced. Care is needed in buying these rigs. Go after ones made with teflon wire. Some of the newer dates havea little to much Rockwell and not enough Collins. By that I means Rockwell bought out Collins many years ago and some feel that the Rockwell units are poorer manufactured.

Generallly speaking one that has not been touched by the local idiot that thinks he is a tech. Most out of the box units that are designed for the US market only must meet certain specifications to be type accepted. There are a large quantity of non-type accepted "export" models that are available. How harmonically clean are these units is uncertain. How well designed the units are is of concerns. Don't let price tag determine what is the best rig. Price tag generally indicates a popular rig and not necessary the best. While many here will condem Radio Shack units, they are very clean. They are also somewhat over priced in my opinion. Most don'y like them because they can not be easily operated outside the standard 40 channels and they are not modifiable much for increased power out. Basically it is a "what you see is what you get" radio. There are other brands alos that are available that are good clean radios.

A second note on a harmonically clean radio. Never have the modulation limiter cut. It should be adjusted to your voice, but never permantly disabled. This can lead to over 100% modulation of AM full carrier and thus splatter and harmonic genration.

james

*yards +" which seems incredibly short for 4 watts, even with a short
*handheld antenna. I mean, why bother? I can _yell_ better than that.
****

Yeah but your throat will get sore soon. Depenading on terrain this is pratical.
If you are inside a building or a house trying totalk to someone out side with a
handheld, 100 to 300 yards is about it. From inside your house withthe internal
antenna to a base station, the distance can be 800 to 1000 yds. Put and external
antenna onthe handheld and it will have the same distance as any 4W unit on that
same antenna.

wrote:

*Recall that one wave length of transmission line is given by the expression:
*984*1/freq. = wavelength
*
*However this is not a true wave length for all transmission line. The above
*formula must be modified by the velocity factor VF in order to get the
*correct length. The new formula is: 984 (VF/freq.) = wave length.
*
*You may ask what is this Velocity Factor: Hear is the answer. The speed of
*the signal in a transmission line is slower the a radio signal in free
*space. This leads to the velocity factor F (I call it VF not to be confused
*with Freq..) which is the ratio of the transmission in the transmission line
*VL and the transmission speed in free space VS.
*This will give use VF = VL / VS. This number will vary from 0.6- 0.8
*
****
the velocity factor is determined solely by the dielectric material used in the
coax. This due to electromagnetic wave propogation thru dielectics varies
depending on the material. Many schemes have been used to speed this wave up.
Different materials, ie teflon, polyethelene, and even air. ANother method to
improve on polyethelene was to change it from a solid to a foam. Thus the
introduction of aiur into the dielectric helped to increase speed of the wave
traveling down the coax. Air is used in high power transmission lines. Thus the
velocity factor can range from about .6 to .99 in coax. Generally speaking the
higher the VF, velocity factor, the more expensive the coax is. This due to
construction of the coax and not the materials.

I believe that on AM full carrier audio compression works good only to limit to 100% modulation. As for effectiveness the rannge increase is minimal. On SSB the effects of audio compression is about 1dB increase. Clipping can give you about another 3 dB increase. RF clipping is by far the best to increase effective range.

All the processing means still will help only slightly.

*Never heard of these tubes. What kind of output can be expected from 4
*of them?
****

Four tubes in plate modulated AM carrier service with 650 VDC on the plates will yield about a 120 Watt carrier. IN SSB amp service with 650 VDC on the plates and 250 VDC on the screens, one could expect to see up to 250 W PEP output. I once ran an amp with two and had 40 watt carrier with 3 watts drive. Had the grids swampped with a 2700 Ohm resistor. Four can get you 80 W carrier and about 320 PEP oout. Now if you really want to push them, raise the plate voltage to 1200 VDC and drive the piss out of them and you will get about 500 W PEP. The tubes will not last long and your neighbor's electronic equiptment will suffer some interferrence. If yo want a nice 250 W PEP amp, four will work nice. Becarefule though the output capacictance of this tube is high. About 8.5 pF. Four tubes in parallel will yield about 35 pF. This will make it more difficult to tune with a conventional pi-network at 28 MHz. At 650 VDC the plate load resistance maybe to low to effectively tune a four tube amp. I reccomend running the plate voltage as high as 750 to 800 VDC and the screeen should be regulated to about 180 VDC. You can even raise the plate voltage up to about 1000 VDC. I reccomend the screen voltage not exceed 200 VDC in this case. The control grids will have to be swampped with a 1K or lower resistor to reduce the gain of the amp and make it stable.

> There was no "intentional hiding" of the problem.

Computer companies didn't intentionally create this problem to
make more bucks and I don't think saying programmers where
short sighted is true either. Back in the day, when most of this problem
code

was written (60s-70s), disk and memory space was expensive and very hard
to come by. Programmers had to save space anyway they could
(both disk and RAM)...so they could cut out 2 digits from every record
they had (from the year field) - and in most cases this saved them
tremendous
space.

Any computer system that is super important - is already fixed. People
are making a buck off the hype more than anything else.

Bob.

The Viking won't be my only HF rig. First things first since I'll be getting a Tech ticket and not bothering with 5 wpm(I figure if I learn 20 wpm from the start I'll be avoiding that 10 wpm plateau that I hear takes a long time to overcome.) My first vhf-uhf radio will be a used IC-Z1A or a IC-W32A or possibly a FT-51r, something I can walk around with and use at home. Then when I save enough money and when I upgrade I'd like to get an IC-706MKIIG. I've heard nothing but good things about icom. So you see I don't limit my self strictly to older equipment, but I do prefer it. There is nothing more pleasing to the eye as an old radio rig that takes up the entire desk emitting a warm glow in a dark room.

Good day,
john

There's a nationwide group of hams that are AM
enthusiasts who run boat anchors such as the Viking II.

You might try listening to 'em in AM mode between 3.870 and
3.880 in the early evenings because it's pretty cool to
hear these old rigs on the air. They are into high-fidelity
"broadcast style" audio, and so there's a lot of tech info
exchanged.

Here's one url that you may find interesting as it
has some Viking II info:

http://www.thebizlink.com/am/tech/htm/mods.htm

Also and index to some general info and articles about
AM boatanchor operating at:

http://www.thebizlink.com/am/tech/htm/tech.htm

These guys that speciaize in this mode and
they can answer your questions a lot better and a
lot faster than I can.

Also you might get a line on a good receiver from
them.

Good luck.

It most certainly DOES relate to amateur licensing. The rest of the
radio world, has acknowleged that CW is antiquated, and has outlived its
usefulness, and has been replaced by more modern modes. It's usage on
ham radio is driven mostly by either dogma or nostalgia. Certainly not
for its convienience.

> Morse code useage among hams is quite commonplace.

And if testing is abolished, your fear is that interest in CW will fall
off, and then the FCC will remove the "protected" CW segments.
Preserving CW is something that is important TO YOU, but not necessarily
in the best interest of ham radio as a whole

>

Keep on holding on to that thought, for soon it won't be true anymore,
and then what?

>
> Hams haven't been in the forefront of radio development for decades
> unless you count engineers who happen to be hams.

But it USED to be! SSB, Repeaters, Mobile radio, antenna designs, and
other things are all developments that started off as "crazy ham ideas",
and were adopted by the commercial industry. We used to be LEADERS, now
we're barely followers.

You squawk at the though of reducing the code test, but why aren't you
as passionate about the lowering of the theory test standards?

If it were up to me, the code test would be history, and the theory test
would go back to what it was in the 50's and 60's. Comprehensive. No

more multiple guess.

>
> > How's that for doom and gloom? Think about it.
>
> Okay, I've thought about it. I still don't think you have a handle on
> what is likely to happen or why we test for CW.

And I feel that you aren't living in the real world, by insisting on the
continuation of a skill that has long outlived its usefulness, and is
only continued for purely recreational and nostalgic reasons.

> Just out of curiousity, how long have you been involved in amateur radio?

Long enough. (As if that's relevant)

Dave

4096. FOR SALE: Silver Face President Jackson

Newsgroup: rec.radio.cb

I was the high bidder in a Ebay auction for a Texas Ranger 699WX(#202046781). The seller was "swilcox03@snet.net ". Has anybody bought anything from him through Ebay? The auction ended on Sunday and he has yet to answer my e-mails for shipping charges, or even where to send the money order. Must not want his money???? This seems kinda odd to me has other e-bayer's have gave him very good feedback. This was my first attempt at ebay, not a very good one. I'm not pissed about this very much as I didn't loose any money, it's just that if I had posted several things on Ebay I would at least moniter my e-mail.

OOK CW is allowed on any frequency. Even if one voluntarily limits
one's operation to the CW/data segments, CW shares the band with data.
I believe ONLY 6 and 2 meters have CW-only segments.

Not necessarily. You may find the +2 has a capacitor on the audio output anyway so the DC bias on the mic line shouldn't impact it. If it is a transformer output, or is otherwise pulled to ground, it would be good to add a DC blocking capacitor to the unit. .1 to .33uF is plenty. This goes in series with the mic line.

HI I think I have nearly the same CB (GE handheld).. I got a pair of them from all my Marlboro ® miles (1100 miles..sheesh) Anyway i've used them in the city and out in the woods....in the city your lucky if u can get around 6 or 7 city blocks.. In the woods your lucky to get 1 a mile... Its a drag to pick up everyone else, but never to have them hear you...Although I have never tried them with a different antenna, they cant be heard by ANYONE... All in all I highly don't recommend them

k-bye,

davemades 1/2 wave have proven to have 3db more gain than a 1/4 wave, which is exactly the gain that you should have going from a 1/4 wave to a 1/2 wave. Just curious how 55's can be any more out of this world when the laws of physics apply 3db is still 3db.

I beg to differ with you. I have many programs that were written in the mid 90's right up to 97/98 that are not Y2K compliant. There is no excuse for that. I find it very hard to believe that (a) they didn't realize that a two digit year date would be a problem and (b) that they were concerned with saving space by this time.

I find it much easier to believe that it was a case of planned obsolescence. By the mid 90's, the software industry already had consumers used to buying an upgrade for their product every couple of years. Why should they release a Y2K compatible product in 95 or 96 when they could release it in 98 or 99 and force another upgrade on everybody? Y2K compatible bios chips didn't start to be plentiful on mother boards until the latter part of 97. Windows 95's Y2K bugs weren't fixed until after the release of Windows 98. WFWG (3.11) is still a viable operating system for slower machines out there that do not run games or edit graphics. Yet Microsoft chose not to make it Y2K compliant. In fact, they abandoned support for the product all together. Was this because they didn't want to spend the time and money to fix it, or because they would rather consumers bought a new OS and or computer? This whole Y2K thing is in my mind, one of the most insidious scams played on consumers in recent years. I'm glad it's a once in a lifetime occurrence.

A four foot telescopic antenna with a center load will get out 5 miles or more during no skip conditions. You can get them at Radio Shack for $ 24.95. On a little rubber duck antenna you should always be able to get out at least a mile or two during good conditions.

Bullshit, Joey.... That is all you play... Games.

Headgames...

Wordgames....

All types of games. Nobody will even attempt to carry on a debate with you
any longer because all you do is attempt to turn words around and play games
with them.

If I misunderstood your intentions,
> I apologize. But I think others may have misunderstood too.

There is a first.. You thinking.

>
> Most respondents to this thread also assumed you were going to put it
> on 11 meters.

Really?

Like who?

Look thru the posts. The majority are giving advice about
> how to put the rig on CB.

Or, how they hooked one up with a CB for a receiver.

All the modifications that are necessary to put it on a transciever for 11
meters would hold equally true if you where going to put it with a Kenwood
for RX.

YOU! where the "ones" that where implying he was going to run it with a CB
radio.

The area above the 440 ham band (450-512MHz) is loaded with business type communications much like the area above 150 MHZ. The modified 2 meter radios
have attracted attention from business users and police who track with doppler set-ups. (see www.dopsys.com) Commercial Folks arent HAMS so beware
of their compliants, the band is also used by the mobile telphone service, so
it can get a high priority. The FCC would be the least of my worries.

4123. Re: What is Range of 4W Handheld CB?

Message-ID: <UvG_3.4208$F7.137836@newscene.newscene.com>
Source record: 12508
Cross-posted to: rec.radio.cb,misc.survivalism

The real answer is "it depends." First off, your 4w handheld is only 4w untill the first time you transmit and then your batteries start stopping as does your power output. Second. Who you talking to handheld to handheld from a car? Across clear open spaces? handheld to base, base on a hill or in a valley. What channel, On trucker channel 19, your luck to get to the next car with all the noise on the channel. You also have to take a look at the antenna. On the handheld you dont have one, You have a rubber stub pretending to be an antenna. A full size cb antenna is 34ft long.(17ft on each side of the transmitter). And after all of that, just how good of a receiver does the radio have? Most "emergeny" radios are bottom of the barrel receiver. Designed for low cost and thats it. So 100ft to 100yrds might be correct. Real world maybe a mile mobile to mobile, maybe 2 miles handheld to base. It depends.

In article <19991123010810.777.HaLoPa@nyarlatheotep.frog.org>, Frog@mageos.com says...
>
>I recently picked up a 4W GE handheld CB on sale for possible emergency

Bill,

While the remark that MC 10kW made does sound a little derogatory, there is much to be said for a piece of equipment like the IFR. I couldn't get along without my 1200 Super S. However, there are many repairs that are made much easier with my old discreet test equipment. (i.e. B&K 2040, Sencore SC61, and the list goes on and on) I think you get my point. ;)

What it means is that in the post preceding mine the person infers that the President 2510 does not have variable power by mentioning that one of the features that the 2950 has that the President does not, is variable power. The facts are that the President 2510, (Lincoln) does have variable power...got it now.

If he is using it for emergency communications presumably he would be calling on channel 9 -- the emergency channel -- which is monitored in my area by the Highway Patrol, and by REACT in some other areas.

If that fails than you would try to contact a passing trucker on channel 19. The advice about getting an external antenna on top of the vehicle is a good one.

Tod Kertz"

Posted on 11/21/99 at 9:22 pm

Then, he apologizes at 9:59, same day.

Just another little insignificant little crack.

We don't care how long you have been on the "newsgroups"... If you truly
where as well versed in the art of the internet, you would not have compared
a newsgroup to a BBS... Two totally different things, and I highly doubt
that you could tell us where UseNet originally came from. And
why.....WHY!!! would someone who was so well versed in the internet, and
been around since the beginning be using AOL????????

If you want to come on the newsgroup and ask for help,

"of all the experts on this group no one can help me with how to modify
channel
expansion and clarifer and 10k sw on. come onnnn

would be greatly appreciated
thank you"

then I suggest that you change your attitude. That is the only reason that I never said anything.

Saturn: Blue wire.

Clarifier: I don't want to tell you how to do it, because if you fuck your radio up, I don't want to be the responsible one for telling you how to do it in the first place.

10Kc switch: Stock. If yours is fucked up, I wouldn't doubt it has something to do with your lack of personality..... I mean, lack of soldering skills or electronic skills as a whole.

We care that you are a DM. DM of what? Radio Shack? Circuit City? Good Guys? AutoZone? Really, but we do care!

About your comment that their are only a couple CB tech jobs per state??? Well, that is all their REALLY needs to be, but since their are so many people into fucking their radios up... err.. I mean, modifying the radios themselves, we have to have a lot more technicians out their to fix their stuff. Sad, but true.

And then, why would you come here and ask for help, since their is only need for two techs per state? Why not run down to your local technician and ask him how to do it. I am sure that he would rather tell you than do it himself.

This is my first time posting on this thread.... I wasn't going to help you just because your a prick, and came to get something for nothing, and when you couldn't do it, you sold the radio at a loss. But, don't expect people on this group to give an asshole anything for free... Life just doesn't work that way.

Have a nice day, Senora Ice Shark..

The purpose of the 102" spacing is to insure a strong signal directly in front of, and behind, your vehicle. This layout is ideal for the trucker who only wants to talk to other truckers on the road directly ahead and behind him. But, for a person who wants to talk in all directions, there is no benefit to the 102" spacing.

I stopped going to BBS'es several years ago because I felt that too
many of the operators were getting a little too nosy. Too many started
to demand my name, home address, phone number, and a whole range of
other information, before they would allow access. Some even started
asking for employer, work number, birthdate, and SSN, during the sign up process.

Since I felt that much of this information could easily be used for
the wrong reasons (and the operator had no business knowing any of
this), I simply stopped signing onto BBS'es.

Today, I doubt that I even have any software easily available to
access a BBS - I'd have to search the internet.

Those would be the Palomar 310M mobile amplifiers.

1 driving 3 X 8950, and they would do an honest 350 to 500 PEP watts.

You could get 1000 out of one, but they would die quickly like that.

They are old, and absolete (unfortunately)... The switching transistors
that they use are near extinct.

Toll Free

>
> Does such a database even exist yet that allows users to search for a 27 MHz SSB station the same
> way the HAM CALL Databases do?

The biggest problem with that, Sean, is that the callsigns used by CB'ers are not unique - there can be dozens of people using the exact same SSB numbers or AM handle. For example, if you wanted to get in touch with "713," it would be very dificult to figure out which "713."

However, in the case of the ham callsign, each callsign is unique - there is nobody else using the exact same callsign on the ham bands.

By the way, the numbers 7 and 13 are very common numbers used in callsigns (713, 137, 007, Charlie 7, Whiskey 13, etc.). A bit of trivia for your entertainment.

4146. Re: What is Range of 4W Handheld CB?

Newsgroup: rec.radio.cb
Date: 1999-11-23 00:00:00 UTC
From: Shaun Hilburn <ehilburn@ix.netcom.com>
Message-ID: <81fkjd$o80$1@nntp8.atl.mindspring.net>
Source record: 12531
Cross-posted to: rec.radio.cb,misc.survivalism

I bought two Maxon 40-channel, 4-watt handheld radios from Wal-Mart. With the "rubber ducky" antenna, they had an effective transmit range of about 500 feet.

The literature included had an order form for the better telescoping antenna, but since these units were such poor performers out of the box, I returned them. I've seen better CB range from the children's CH14 walkie-talkies.

I had a Radio Shack TRC-201 once, 3 channel, 2 watt. I could get about 8 miles out of it. It had a telescoping antenna about 4 feet long.

I now have a couple of Motorola Talkabout 250s. They get about 1.5 miles from inside the truck to the kitchen. 14 channels, 38 anti-chatter codes, scan and keylock, 3 AA batteries. I love 'em.

> I see a radio seller's page that gives the unit a range of "100 feet to 100

Mr. Wilcox and I have talked now about the time lag on e-bay. He had things that needed to attend to that was more important than silly e-bay. This was my first time to use ebay and I got nervous, hearing about all the horror stories and scams. The problem is that with my sarcasm I have scandeled a honest person. I apologize for any damage done, any nobody should have any hesitations about bidding on any of Mr. Wilcox's auctions.

> that they were concerned with saving space by this time.

Actually, many are simply using that (digits left off to save space) as an excuse. In reality, I don't think many of them, just like many of us, even thought about it.

When many of these programmers were writing this code, they were concerned about it working right then (that week, that month, that year). They were not even thinking that far down the road to worry about the turn of the century. Now that applies to those who were programming twenty years ago and those programming two years ago.

It was only recently that the turn of the century made it into our collective consciousness on a higher level. And it was only then that programmers started thinking about the effects of that century change on their software.

Now, not all of this can be blamed totally on the programmers. In many cases, the programmers thought they would still be employed in the future, so felt they could address any problems as they came along (software updates, new verisons, etc).

However, many employers dumped those old programmers when they started demanding more money to continue to work on these programs (the programmers had the nerve to think they should share some of the profits of these seccessful programs). When these programmers left, much of the knowledge of the programming within these programs went with them. Now, these same employers are paying for their short sightedness (well, actually their customers are paying).

The same with government computers. The military, for example, hired programmers to write a specific program to do a specific job. When that program was finished, they saw no reason to keep the programmers around. They, like many employers, simply never understood that a program is not ever completely finished (there is always some new issue that will have to be addressed in the future - new hardware, new conditions, new requirements, or even a new date).

Programmers will not make the Y2K mistake again. However, there will always be situations where new changes will cause problems for existing

software. Perhaps companies in the future will get better at dealing with this.

Has anyone had a Radio Shack HTX-10, 10 meter mobile radio apart?

What PLL/Controller Chip is in it?

Is it similar to the old Radio Shack TRC-485 and the Copper/Eagle Sidewinder 400? These two radios have physically similar PLL/Controller chips with slightly different different usage's (11 meter vs. 10/11 meter) burned into them (different suffix coding).

well they are deffinetly smok'n units. i have had the m-40, 80, 200, and the 400..
but they are alittle hard to get a hold of, and it usually takes a while. they lak in pr work but they are deffinetly good boxes and priced right too. looking to upgrade to a m-600 now..
my 2 cents.

4166. Re: apology to all CB techs on this NG

Newsgroup: rec.radio.cb
Date: 1999-11-24 00:00:00 UTC
From: mobile51@aol.com
Message-ID: <19991124081401.27323.00002633@ng-fi1.aol.com>
Source record: 12551

Takes a man to admit when he has made a mistake. It's also free, and you feel a lot better after it's done! Stop by and take that tech a nice lunch one day before Christmas. He won't turn a nice lunch down.
<><><><><><><><><><><><><><><><><><><>

I want to take this post to apologize to all the techs on this group. I took your advice and took my saturn to my local tech here in wash state. I was amazed at watching him find the main problem whitch was a cracked edge of main board splitting a trace. He fixed it along with some other hack jobs he said were typical of do it your self mod book techs. He showed me around the inside of the radio and tuned it up and took care of bad mod job and week solder joints. All this right on the spot at the same time he had 3 truckers come in with varios other radio problems and he fixed them all as they waited. To top it all off he only charged me
65.00. well worth the work done.

I stand corrected on my past comments. You techs are a needed and greatly appreciated bunch. If not for techs I would be talking on my old radio again.

Also I gave tech an extra 10.00 as a tip for fast work and he woulnt take it.

again sorry all.....
Have a happy thanksgiving.
From the now tech loving happy saturn owner.
Tod Kertz

By a real radio I take it you mean some sort of "name brand" thousand
dollar plus amateur radio? No I don't want to discuss the ubiquitous
"used for half price" non existent ones always brought up in these
discussions either.
Is there any particular reason why this radio is not good, or is it
the basic coin flip type of opinion I'm getting here?

Bottom line? You get what you pay for, and here you got a real deal!

4169. Re: HTX-10 10 Meter radio. Look at this clone, It's looks like a shack model

Newsgroup: rec.radio.cb
Date: 1999-11-24 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <81gtljadt1@birch.prod.itd.earthlink.net>
Source record: 12554

Radio Shack did indeed sell a CB called I think the TRC-485 that looks
EXACTLY like the HTX-10. In fact, promotional literature shows them
to be almost identical, with the exception that the HTX-10 had a 10M
frequency on the display, and the TRC-485 had channel 40 frequency
with a '40' on the side.

Speculation is the TRC-485 was manufactured in 'international' versions,
by Hyundai I think, for various vendors, in differnet frequency ranges
and modes,
including FM for european markets. All that really happened is the
engineers put the verious 'all together' for a 10M radio, which, by the
way, is offered by various vendors under various names.

I believe that YOU have taken my comments out of context. Your paranoia
is very evident. My second paragraph was merely stating that many of us
(myself included), are not opposed to creating new band segments to NEW
and different voice or data modes that are more in line with modern
communications techniques, at the expense of older, less used modes. I
am very much in favor of ham radio PROGRESSING. If we can prove to the
FCC that we are progressing, there will be less incentive to just shut
the service down.

Let's see if I've got you straight here. You say that *I'M* out of
touch with reality because I favor technical advancement for ham radio,
rather than stagnation by continuing to emphasize archaic modes? You
would prefer that we all go to our early ham graves (Metaphorically
speaking) clutching our CW keys, screaming "CW forever!", rather than
attempt to save ham radio by modernizing it? That is simply an illogical
position, which further proves that your arguement is based mostly on
emotion, and not on any relative facts.

That logic is reminiscent of the same protectionist logic that horse
traders used when Henry Ford started making cars.

Then prove me wrong. Otherwise, it's just your OPINION, and it holds no
more credibility than mine.

> Lawless idiots, both within and outside are much more the primary source.

This problem transcends radio hobbies, into society in general. Ham
radio is just a mirror to the greater moral decline that has been
propagated by our "liberal" thinking "scholar" types, rather than good
old fashioned Godly values.

> So Dave - "Sandbagger", what advanced digital modes are you
> set up[to use right? SSB, on 27 mhz??

Ad Hominem.. You're predictable if nothing else......

As for digital modes, I'm ready to start playing in the digital sandbox
just as soon as I find other people of like interest. It's no fun
talking to myself.

> Well clearly you really ARE stupid

Another blatent character assassination attempt. I'm beginning to see
that you have no real substantive points to make with regard to the
topic. You're main defense is to attack the character of your opponent.

Not a very effective debate technique. It certainly won't endear you to
those on either side of the arguement.

>
> And if you want that extra few miles

No, YOU are wrong. Plain and simple. Take a poll on rec.radio.cb, and
find out for yourself why most of these guys would rather stay on 27
Mhz, rather than take the ham test. I did, and I was surprized, to say
the least.

There is already a simple to get no-code license. These CBers that you
fear so vehemently, have the chance, but they don't take it. Why?
Because in almost every case, that's been posted on here, they reply
that they don't like the stuffy, arrogant, condescending personality
that the hams that they encounter, display. To put it more simply, there
is no fun there for them. This may all be well and good , since ham
radio doesn't need people with no respect for rules and proper
operating. But there are some really talented CBers, that would make
great hams, except that they can't deal with the ATTITUDE. But it's not
the code that's keeping them away. Code isn't REALLY that hard to learn
(Even I did it with the "Wayne Green" method) for someone that wants to
use it. But it is an unnecessary stumbling block, for someone who has no
desire. A better testing alternative would be a more comprehensive
THEORY test. At least the theory can be applied to each and every facet
of ham radio. That way maybe we'll get more intelligent radio techies,
interested in jump starting ham radio back into the forefront of
technology, rather than a bunch of 20 WPM appliance operators, who can't
solder a mike plug, or coax connector.

> But don't get too excited about bringing all yer lawbreaking
> buddies to ham radio. It doesn't look too promising.

I have just about said all that I will say to you. You continually throw in Ad Hominem comments, and unfounded assumptions, that you can neither prove, or that relate to the subject at hand. Some of your comments border on libel which, under different circumstances, could turn into a financial burden for you. You have not learned to THINK before engaging your mouth (or fingers), and make blanket generalizations. Unless you can keep your comments restricted to the topic, without taking jabs at your opponent (which is usually the tactic of the losing side), you stand no chance of convincing anyone of the few merits that your points bring. But this is typical for a topic such as this, which is based mostly on emotion, and not on fact.....

Dave

That is STILL not a good enough reason to FORCE EVERYONE to learn it. I can get by just fine on ham radio without EVER needing or wanting a code key, so why shouldn't others, who also have no interest in code, be forced to learn it? If you get the urge to try it, and you learn it on your own because you WANT to, then that's great.

Kids still use to tin cups and a string to communicate (If daddy hasn't bought them cell phones yet), but it is far from the most effective communications mode. There is very little reason why CW is used over voice, except personal (emotional) attachment. In most cases, there is nothing that can be done on CW, that can't be sent on voice or digital, faster, and more reliably. There are very few daily cases, where CW ops are on CW because voice wouldn't work. They are there because they WANT to be there. Because CW proponents love, cherish, and worship their mode, is no reason to force the rest of us to learn it.

Well, you guys will be getting break for a while from me. I am in the proces of moving. The computer will be packed away, and I will be taking down antennas, and will be "off the key" for about a week.

Maybe this will all settle down to a dull roar by then, but I doubt it. This debate has been going on for as long as I've been licensed.

Please don't misconstrue my comments as "trashing" the emergency communications aspect of ham radio. RIGHT NOW, we serve as an effective backup for commercial systems that are normally in place, and we, for the most part, do an effective job.

My point was that, at some point in our future, these commercial systems will evolve to the point that they will be reliable enough that ham backups will no longer be necessary in all but the most extreme scenarios (Asteroid impact ;)). As the emergency function of ham radio starts to shrink, the service will need a new reason to justify its existance, if we hope to compete for valuable RF spectrum.

Ok, I'll admit that my using the phrase "into the 21st century" is a bit cliche, and does not entirely capture the true meaning of my point.

This is about choice, and what is truly the direction that we want ham radio to go.

Part of what decides our future, is perception. Perception by people in power, but are not necessarily in tune with the nuts and bolts of our hobby. To an outsider, ham radio, looks like "ye old wireless" museum (People have commented this to me already). If we continue to EMPHASIZE something that's as old as the last century, then it becomes hard for this person to rationalize keeping this service alive when modern commercial companies propose using ham freqs to setup Voice/Video/data links that can enable you to be in constant contact with whatever you want, wherever you go, in real time, etc etc etc......

But, on the other hand, we "modernize" ham radio, by at least TRYING to embrace the same technologies that the commercial companies use (Can you imagine the bandwidth savings if we converted 2 meters from FM to the same digital scheme that Nextel uses for their phone/2ways?). Digital

technology also offers a way to code ID's which would make speaking them every 10 minutes, superfluous, and would make it more difficult for jammers to cause havoc. "PL" takes on a whole new meaning when you kick in a rotating DSC encryption algorithm. Jammers will not even HEAR you, let alone disrupt you.

But even so, you would still have the CHOICE of using old fashioned CW (or SSB) if you desire. You should not be forced to cross the CW bridge unless you WANT to.

Dave

> of Ham radio?

Because it is antique. It has outlived its usefulness. It's primary appeal, today is as a novelty mode, for people who ENJOY it, but do not necessarily NEED it.

I personally have nothing against people USING CW, as long as they don't feel that "everyone has to do it because *I* did".

For something to survive, it needs to adapt, evolve, and keep ever aware of coming changes in its environment. If something refuses to move ahead, then it becomes stagnant, and will soon wither.

Ham radio is stagnant. For the most part, the people there are appliance operators (I'm guilty too in some respects. I operate "store bought radios", even if I built the repeater). They are still using the same modes as they were 50 years ago. Yes, there have been some "enhancements" in radio technology, which make it possible to hear better than years ago. But the building blocks are still the same.

How much longer are we expected to continue with old traditions? When do we finally say goodbye and move on?

I know plenty of people who own, ride, and maintain horses. They are fun to ride, they are nostalgic, romantic, and less stressful. But none of these people ride their horses to work, or on the freeways.

So the choice becomes:

Do we maintain ham radio at status quo, for the people who hold many years of fond memories. A place where time stands still, and remains at the same relative technology level?

Do we recognize the contributions of the many facets of ham radio, but strive to embrace new and more diverse technologies and modes, that will

become the building blocks for our radio and data needs "into the 21st century" and beyond?

Growth = New modes and technologies.

Stagnation = Preserving "the old".

So tell me which is better for ham radio for the long term?

Dave

Absolutely right. Please, don't think for a minute that I am downplaying
the very REAL Y2K computer problems. What I was downplaying was all the
generated media hype, surrounding the alleged fallout from this
relatively simple(Not simple to fix, but simple in nature) computer
problem (Airplanes falling from the sky, electric going off, elevators
stopping, traffic lights turning blue, etc...). I shake my head at how
easy it is for people to buy into this hype, and to set them up to be
scammed by clever people offering to "Y2K proof" your home, car, office,
whatever. In many cases, what they sell is legitimate, but would
probably not be necessary, had it not been for the hype. There are a few

companies selling battery, solar, wind and gasoline generator power sources, for the alleged long term power grid outage. These are all fine products in their own right. But many people will be very pissed that they spent all of the money to create this "self sufficiency", when the power grid never goes down, or is down for only a few hours.

> Any computer system that is super important - is already fixed. People
> are making a buck off the hype more than anything else.

Exactly! My company has tested all of its systems for Y2K (and other sensitive dates), and we're clean. But they're going to pay me a $1000 bonus to work over the new years transition, for any unplanned problems. So Y2K will be profitable for me as well.....

I am paying attention. You were a bit ambiguous in your assignment of "they". We had been talking about Cbers, which then got changed to HAARP. But in your last reply, it was unclear if you were still refering to the HAARP engineers (Which are in Alaska, not Fort Collins), or the "loud and proud" CBers that we were originally talking about.

No matter, my original point is still valid. CBer's cannot create their own DX conditions.

Sounds like a keeper. Your tech sounds like an honest straight-up guy.
Someone you will want to stay on good terms with. There are a bunch of
good guys like that out there, amidst a sea of "wannabees". The best
homage that you could pay to this guy is to recommend him to all of your
friends. Send work his way, and he may be kind enough to cut you a break
off of your work, or might teach you a few "secrets".

4182. 6KG6A/EL509 Substitute for 8950 Tube?

Newsgroup: rec.radio.cb
Date: 1999-11-24 00:00:00 UTC
From: DavidC <eDoc@netzero.net>
Message-ID: <s3o5i9l3rrp89@freenews.remarq.com>
Source record: 12567

I am looking at an amp that runs one 8950 driving three
other 8950's.

I know that the 8950 tubes are priced out of sight but am
told that with a filament change from 12v to 6.3v the Svetlana
6KG6A/EL509 is a direct replacement. True?

If more than the filament voltage needs to be changed, what are
the other changes, please?

What sort of average peak SSB output should I expect? Not
momentary whistle or shout swing but solid voice output power?

I am also told that the 6KG6A/EL509 tubes run about $20. each,
anyone have a better source if I buy 4 or 8 at a time?

- Thanks! DavidC

all radios use line of site to transmit a signal
all antenna use line of site to get a good signal & they need a good
power source to transmit mit and receive this is the best antenna a lot
better than a stock you might get 100 ft. to 1 mile the antenna below
you get 3 to 5 miles both tx & rx
C.CRANE has a 30in. handheld antenna that is great to use the best i
have come a crossed for a hand held here is the info. on it
SUPER CB RUBBER DUCK
Cherokee has a great new Rubber CB antenna to give 25% greater transmit
distance to any portable CB radio. If both of your CB units use them you
increase distance by 50%! Size: 30" long. BNC connector. Item #SA4
.....$29.95

<<you dont know what your talking about dwight. he wasnt talking about made up callsigns but rather those you hear on 11 meters from dx groups and there are several data bases like that already.>>

Doesn't make any sense, though. What's to stop Fred, "19IR01" from New Jersey (he just picked the number out of a hat) getting confused with Tim "19IR01" from Germany?

And since everyone's "anonymous", there could be a dozens of duplicates of "callsigns". No one can actually know, with any certaintly, exactly who they are talking to, and where they are located, because (I am told) most "cb dxers" prefer things that way.

Small FLAME ON

I don't know about everyone else, but I am getting tired of this.

MAYBE means perhaps

WERE means
were (w&#65533;r)
v.

Second person singular and plural and first and third person plural past
indicative of be.
Past subjunctive of wish.

Perhaps you meant

we're (w&#65533;r)

We are.

Although this is listed in some dictionaries, I believe it is a 'modern'
addition to the language.

The correct spelling is:

They may be watching, but we are listening.

Small FLAME OFF

Why are we limited to your list of two choices? We is quite possible to adhere to the traditions of amateur radio and to experiment with new technologies as they come along. As to radio and data "needs" what might those be? What form would they take?

> Growth = New modes and technologies.
>
> Stagnation = Preserving "the old".
>
> So tell me which is better for ham radio for the long term?

And if I don't care for your two definitions? How about:

Growth = more people becoming hams

Stagnation = No more people becoming hams

or

Growth = more hams upgrading

Stagnation = more hams staying at the entry level

How did it come to pass that you get to list our choices and make up our definitions?

Yes , I know , There is no problem using the equipment I have, I have "accumulated" it over the years. I could go out and get a top of the line network analyzer and all the fancy stuff. However there are enough folks on these news groups alone that know I only charge 25-35 dollars for almost any repair (except extremes) and have 3 day turnaround and what would they say when I have to charge them 5 times as much to get the same job done using "over-kill" equipment and if I played "Super Tech" as most do? I NEVER claimed to be the best nor do I actually claim anything. I fix a radio and do it right, thats why I get so many of you people that return. You people that I do work for know me. Why set up SSB frequency with a 7 thousand dollar analyzer when I can do the exact same with a 2040? , Thats for the "Super Tech's" not me.....Actually I work for a defence contracter and have for the past 17 years. I don't even think about making a living off of CB. I do it because I love it. There is nothing wrong with that. Beware of people who "claim" to be so called "Super-Tech's". They are nothing more than a person trying to be a dream...

Again Arnie you are making an assumption that any No Code Test Advocate who uses the Term CW in their post is automatically attacking the Mode. I am one of the strongest advocates of eliminating the CODE TEST, NOTICE I SAID CODE TEST, that you will find in the ARS yet I AND MANY OTHERS COULD CARE LESS WHETHER YOU OR ANY OTHER AMATEUR IN THE ARS USES MORSE CODE ON THE BANDS. Sorry about shouting but it seems the only way to get the point across to you.

Most of us don't have a problem with its use on the bands, what we disagree with is using it as a filter to limit access to the H.F bands or as a heavily weighted PASS/FAIL TEST ELEMENT.

>

Based on what you just said, we should put *all* analog voice modes to pasture. SSB is at least fifty years old and hasn't changed much since then. Are you saying that we should not use it on HF anymore? I personally have nothing against SSB, as long a people don't feel that I *have* to do it just because they do.

Secondly, you must nevar have heard of the National Traffic System, huh? NTS CW nets send thousands of pieces of traffic a year and the NTS is an integral part of local and National emergency communications. Right, CW is a novelty. Listen on 3593 at 7 and 10 pm EST (GSN) or 3567 at 7:45 and 9:pm EST (4RN) and see just how *serious* CW traffic handling can be. You are seriously mis-informed, my friend.

You have blurred the line between testing and use, haven't you? If you are saying that we should not use CW in the ARS because is antiquated, then you and I and a whole *lot* of other peole who use CW on a regular basis are going to have a huge fight.

>For something to survive, it needs to adapt, evolve, and keep ever aware

If CW is so dead, then why are many multiple manufacturers still making thousands upon thousands of keys , bugs, and paddles per year. Are they bad businessmen, or do they know that there is still a huge demand for the product?

>Ham radio is stagnant. For the most part, the people there are appliance

What's better for Ham radio in the long term is to preserve the traditions
and continue to use CW. The testing issue is just that, another issue.
Don't confuse or blur the two, as you obviously have done. Mr. Jones *was*
right.

Mr. Townsend,

No need to yell :-) I know that *all* NCTAs don't support the abolishment
of CW as a mode. But a fairly good number of them on this NG *still* are
confusing testing with use. For example:

> Dave Hall wrote in part ...
>
"And if testing is abolished, your fear is that interest in CW will fall
off, and then the FCC will remove the "protected" CW segments.
Preserving CW is something that is important TO YOU, but not necessarily
in the best interest of ham radio as a whole"

>

I replied ...

> Please explain why preserving the *use* of CW is *not* in the best
interest
> of Ham radio?

He answered ...

"Because it is antique. It has outlived its usefulness. It's primary
appeal, today is as a novelty mode, for people who ENJOY it, but do not
necessarily NEED it."

Notice that I not only wrote "use" but put it in astericks so testing
wouldn't be confused with use. Do you really think Dave is advocating a ban
on the use of CW, or has he just confused testing with CW use?

The RS HTX-10 uses a "different version" of the processor chip that won't mod. Look at the superstar 4900 & Magnum 257 (same radio) for a mod-able version of the HTX-10. Also the Titan II is a 12W version (mod-able) of the same radio. The mod-able versions sell for a little more .....

I noticed the clarifier +/- 2kc is listed under receiver specs. Does
this mean you can't slide the TX frequency right out of the box?

Only has five digits on the freq. display. Useless for SSB.

Piss poor selectivity.

This is just a typical CB with a few TOYS/R-US options. The
macho name, "Delta Force- Magnum" was designed to mask
the fact that their are more childish toys than radio here.

Hello, I have three of these I've accumulated over the years.. you can probably make at least one working one out of all three, they are fairly intact, one missing relay, one has non-original meter, etc... although no tubes

They all took four 8950's each, so they probably packed a whallop when working.

I was going to become the only Ham in NJ with a mobile tube rig on 10 meters, but now I don't have the time to study for a license, so i'm selling off my stuff..

Price for All three is 95.00, * AS-IS *, I assume no responsibility for what you do with them.. INCLUDES postage from N.J.

Respond privately if interested.

Greetings!

It's better to disable the power supply line [thru a resistor] when
using this on the Pro510e - the Pro510XL uses a simple 4 pin and is a
dynamic element.

The squeal is due to the feed line right into the power supply feed.

Very little bypass, or not enough to handle a power mike.

While Dancing with the Mouse on Tue, 23 Nov 1999 22:25:32 GMT, the
Modem interrupted with an MNI from "MC 10kW Jesus
<qsl27@hotmail.com>", and the MotherBoard buffered this to Video RAM:

Dave, a computer can be used to transmit and receive CW as well. So
can a memory keyer and a decoder such as the MFJ-462B. Despite that,
those who don't know Morse aren't likely to tie up large hunks of
spectrum using the CW mode.

One who cannot speak could still use a vocoder. It works well enough
for the USCG to use one to transmit their regularly scheduled maritime
weather broadcasts on HF from NMN and NMG, after all.....

I'd go for the X-Force. As good or better than a Dave box, better customer service, warranty, more options available, and you don't usually have to wait to get one.

Phone, packet, ATV, SSTV, RTTY, AMTOR and PSK are in widespread use,
too. That, if nothing else, is a reason we should, by your logic,
start testing for those modes as well.

<nojunkmail_n3cvj@worldlynx.net> wrote:

>If we don't grow as a service, we will wither and die. The old
>"providing emergency communications" arguement is slowly losing clout.

Nevertheless, here in North Tonawanda, NY the city government has requested that we amateurs staff the city Civil Defense EOC on New Year's Eve and that we be prepared to assist the city police and fire department with communications in case any of the Y2K doom-and-gloom stuff turns out to actually have any merit...and this is in a city where the public safety comms are on conventional VHF/UHF systems, not a trunked system in 800 MHz. And the only hospital in the city has requested through the American Red Cross that amateurs be provided to assist with communications there as well.

I find it interesting to note that, despite the trashing of amateur radio's emergency communications capabilities that goes on in some circles, it seems the authorities always know where to turn when the chips are down, or even when the chips MIGHT be going down.

I know for a fact that we aren't the only locality whose government officials have asked amateurs to be prepared for Y2K, and in some cases that applies to CB operators as well, particularly in those areas where an active REACT group still exists. So, while the number of instances in which the situation actually warrants the NEED for amateurs to provide emergency communications, I wouldn't be so quick to conclude that this equates to a widespread perception in the various levels of government that the capabilities of amateurs to contribute their skills in the event of an emergency has been seriously diminished.

For the most part, the powers that be are well aware of the value of organizations such as ARES, RACES, and REACT, and in areas where there has been a dialogue between such amateur organizations and government officials, the foundation has been in place for some time already. That is the case here, where I live. In other areas, where such dialogue has not yet taken place, it is the responsibility of the appropriate people in the amateur community to see that it does take place. It is too late to set up an effective organization and establish a rapport with local authorities AFTER the hurricane or tornado or earthquake has already devastated your area.

Where I live, we've been fortunate to have good ARES coordinators and we have established an excellent rapport with local government. This,

bluntly, is how it's supposed to be done. If the "argument" (as you put it) of providing emergency communications as a means of justifying the existence of the hobby holds less clout in your area (and this applies to everyone, not just to Dave Hall whose message I am replying to) then it's time for you to seek our the ARES and RACES officials in your area and find out why that is the case, and do something about it. Lamenting the facts will not change the facts. The ARES and RACES coordinators in your area represent amateur radio to the government officials in your area. If they aren't doing a good enough job at it, then it is up to you and other concerned amateurs in your area to change that situation. ARES is part of the ARRL Field Organization. RACES is a somewhat different animal, but in many areas - including where I live - the personnel are often the same.

Seeing as how, somewhere along the line, this thread got cross posted to rec.radio.cb as well as rrap, I feel I should also point out that the same applies to REACT groups. There is no longer an active REACT group where I live, they folded shortly after FCC stopped issuing licenses for CB stations. However, many areas are still fortunate enough to have active local REACT groups, despite the general indifference of the national REACT organization, and in many such areas the REACT volunteers are part and parcel of their area's disaster communications planning. If you live in an area where the local REACT chapter has not established that kind of rapport with government officials, it'll do no good to remain outside that organization and vilify it - join it and fix it from within. It's always easier working within the system. :-)

You are right and wrong at the same time, Dwight. Yes the debate is about code testing, but the NCTAs are blurring the line by attacking CW the "Mode" to make points. For example, when I make a comment about how fun I think CW is, a typical NCTA response would be that I should get out of the "Stone Age" and into the 21st Century because Morse testing should be eliminated. (when I never mentioned anything about testing; only that I enjoyed using CW) This is the point that Mr. Jones was making, and I agree.

4248. apology to all CB techs on this NG

Newsgroup: rec.radio.cb
Date: 1999-11-24 00:00:00 UTC
From: iceshark@aol.com
Message-ID: <19991124034821.25745.00001166@ng-fu1.aol.com>
Source record: 12633

I want to take this post to apologize to all the techs on this group. I took your advice and took my saturn to my local tech here in wash state. I was amazed at watching him find the main problem whitch was a cracked edge of main board splitting a trace. He fixed it along with some other hack jobs he said were typical of do it your self mod book techs. He showed me around the inside of the radio and tuned it up and took care of bad mod job and week solder joints. All this right on the spot at the same time he had 3 truckers come in with varios other radio problems and he fixed them all as they waited. To top it all off he only charged me
65.00. well worth the work done.

I stand corrected on my past comments. You techs are a needed and greatly appreciated bunch. If not for techs I would be talking on my old radio again.

Also I gave tech an extra 10.00 as a tip for fast work and he woulnt take it.

again sorry all.....
Have a happy thanksgiving.
From the now tech loving happy saturn owner.
Tod Kertz

> (when I never mentioned anything about testing; only that I enjoyed using
> CW)

I'm sure that some no code-testing advocates (NCTA) do lump the two
together (CW advocates and CW testing advocates). And they are wrong
for doing that, just like you are wrong for grouping all NCTAs together
above ("...the NCTAs are blurring...").

However, none of this applies to me. I did not advocate anything in
my message (other than an opinion on why some continue to support code
testing so strongly). I did not say anything about the elimination of
the use of code, nor did I say anything disparaging about CW users.

> This is the point that Mr. Jones was making, and I agree.

I seriously doubt that was the point that Mr. Jones was making because
obviously it did not apply to me. It should be clear to anyone that I
was only talking about the testing debate, Arnie.

In fact, the very first sentence of my message contained the words,
"...the code test requirement..." And I even defined who I was speaking
about in that very same sentence - the "pro-code side" (a reference to
Dave Hall's comment about those supporting code testing).

I should also point out that I used some variation of the word "test"
seven times in that short four paragraph message, so obviously I was
talking about testing, not CW or CW users in general.

Therefore, Mr. Jones would have to be really ignorant if he did not
understand who and what I was talking about in that message. If we are
to assume that he is not that ignorant, then his suggestion that I did
not "understand the players" could only be taken as an attempt to
distract from my comments by belittling me.

I really hate these damn code testing debates. I'm sorry that I ever
posted that first message. I should have known that I would have to
post half a dozen messages defending my comments, no matter how neutral
those comments were.

FS.

Cobra 85 23 channel base station in A1 working order
Cobra 139 XLR with upper and Lower channels and varable key a very nice radio.
Realistic TRC-458 base radio AM/SSB upper and lower channels and varable key.
Cobra 86 XLR 40 channel with the extra channel mod done.
I also have the following mics
D104 MB6 hand mic.
D104 desk mic BEAUTIFUL mic!
turner + 3 desk mic great mic also.
turner expander 500 desk mic.
and 3 other hand power mics. one i couldnt find a name but it works good and the other two are a Realistic and a Deseal and the good part about these mics are NONE of them use the high dollar batterys.

If anyone is interisted in the whole lot then i will take $350 shipped or best offer...or if someone is just interisted in just one idem we can do that too.

I'm sure they do. But, considering all the connectivity junk they
stick on the hard drive (Netscape, IE, AOL, etc.), it might be a little
hard to find it.

My typical solution to all this bloat is to trash anything that I
don't plan to use regularly. So, if anything like that was installed, I
trashed it without consideration.

However, I guess I could reinstall it from the CD, so I should not
have said that I would have to search the internet for a program like that.

Dave,

You have given me an excellent opportunity to make a point. It seems that this moving into the 21st Century is important to the NCTAs, I agree. With multiple computers (my slow computer is a 233mhz) configured as a mini-network (Y2K compliant) , DSP technology at my fingertips, state of the art HF rig, and mobile rigs, and all emergency power capable, I think I have taken the steps to enter the 21st Century. Why make this blanket comment because some of us choose to use CW as our primary mode of ARS communication. I and a lot of other Pro-code advocates are well ahead of the moving into the 21st Century curve.

Regards,

Arnie -

> other information, before they would allow access.

You can thank the feds for that. They made the reins on the BBS SysOps so tight that they couldn't do anything but collect a complete dossier on every user.

Did you know that a "PUBLIC FORUM" bbs System Operator was COMPLETELY liable for anything posted to his system message boards? And, unless he could "blaze a trail" to the original poster (for drug and bomb scare tactics, no doubt) he would be the person prosecuted. This also had a LOT to do with the upstart SPA and them trying to get piracy rates down.

Sound far fetched? We had a couple sites that where shut down because they wouldn't / couldn't answer the "proper" questions because they allowed anon access for years. When the feds wanted the info, they closed up shop.

Some even started
> asking for employer, work number, birthdate, and SSN, during the sign up
process.

That is a little far fetched, although if they offered E-Commerce (some did, where you could purchase things on line in the instance of a computer store's BBS) I can see their point.

>
> Since I felt that much of this information could easily be used for
> the wrong reasons (and the operator had no business knowing any of

Somehow I doubt seriously that you where missed if you took the same attitude that you do on the newsgroup(s).

Yes, it can be used for bad, but that is a risk that you take. Yes, it is none of their business, but when one person is responsible for YOUR actions, a proper point of contact really is necessary to protect themselves.

Don't believe that, ask Bill Cheek.... (anyone heard from Mr. Bill about how his legal battle is going????)

The answer to that Question is simple Arnie, ask him. Most pro-coders protect CW as a mode by always pointing out its so called advantages over all other forms of communications. They constantly harp on its so called technical advantages, call it a tradition and even attribute almost Mystical qualities to its use as a mode.

Then when someone who sees their post attacks these so called advantages or claims on the newsgroup or points out that the Mode has declining support or that the advantages that the Pro-coders attribute to the mode may not always hold up to close scrutiny. These operators are attacked and your side says " see it is not the test that they want eliminated but CW as a mode."

Actually, I'd worry more about the 18-20+ gallons of gasoline more. The minimal amount of propane, or isobutane needed to replace the R12 in the average system is going to be fairly quickly diluted if the system is compromised. BUT, that doesn't mean I recommend it, either.

TRC485 and HTX10 seem to have quite a bit different
innards. (1 transistor vs 2 transistor finals =>
around 12W vs 30W power), etc. HTX10 seems to be
the "latest version" of that platform.

BTW, it would NOT surprise me if two identical cases/
faceplate & display setups had completely different
& unrelated innards. Often these cases are bought
just like any other part on the radio - cost, style,
ergonomics, etc. all play a part.

Howdy,

Looking to down load an image of the front face of a 2510 for the web-age that I'm working on right now.
Anyone know where I can find a good one? In colour, if possble, but if it's black and white, I won't lose any sleep over it.
Thank you in advanced.

You didn't answer my question. You turned the point on its head and started talking about pro-coders and their attitude. Answer the question. and, those "so-called" advantages do exist. Even the most staunch of the NCTAs agree with that point. I don't know what your experience with CW has been, but I can tell you that *I have* experienced some of those advantages.

>Then when someone who sees their post attacks these so called advantages or

>
>
Did I sing the virtues of CW in my post to him? Answer, No. Did I say that CW testing should stay as a requirement? Answer, No. Your point, mute.

The words "most" and "all" in the previous sentence make it an incorrect
statement.

> Then when someone who sees their post attacks these so called advantages or
> claims on the newsgroup or points out that the Mode has declining support
> or that the advantages that the Pro-coders attribute to the mode may not
> always hold up to close scrutiny. These operators are attacked and your side
> says " see it is not the test that they want eliminated but CW as a mode."

If their assertions were as accurate as the first sentence above, they
should expect to receive some comments adverse to their point of view.
Much of the problem on the newsgroup derives from people overstating
their case. In doing so they exaggerate and makes erroneous statements.
Most reasonable people see these errors. The hotheads simply retort by
making equally ludicrous remarks in the opposite direction, IMO.

Dwight Stewart wrote
>Therefore, Mr. Jones would have to be really ignorant if he did not
>understand who and what I was talking about in that message.

Here's your *exact* quote Dwight:
>>Actually, I think the idea of reducing the code test requirement
>>induces a jealous reaction on the pro-CW side.

My translation of that statement is that you think all hams who like CW (pro-CW) will have a jealous reaction if the code speed test is reduced. That is not true. Many of us are pro-CW and would like to see the code speed reduced. I corrected you because many people don't or can't differentiate between pro-CW and pro-code test. I thought you were one of them.

>then his suggestion that I did
>not "understand the players" could only be taken as an attempt to
>distract from my comments by belittling me.

If you stand by your original statement, then you truly don't understand the players. If you made an error and meant to say "pro-code-test side" instead of "pro-CW side" then why not just admit your error?

>I really hate these damn code testing debates. I'm sorry that I ever
>posted that first message. I should have known that I would have to
>post half a dozen messages defending my comments, no matter how neutral
>those comments were.

Incorrect assertions, no matter how neutral the writer thinks they are, are subject to correction. If you are sensitive to belittling, then set the example and don't practice it by publicly speculating on my ignorance...

From: Toll Free <tollfree@bigradios.com>
Message-ID: <%G__3.117$y3.6496@insync>
Source record: 12671

I have answered your questions below...

> I am looking at an amp that runs one 8950 driving three
> other 8950's.

Ouch.. 3 to 4 hundred dollars when it comes time to retube! And that price will only go up.

>
> I know that the 8950 tubes are priced out of sight but am
> told that with a filament change from 12v to 6.3v the Svetlana
> 6KG6A/EL509 is a direct replacement. True?

Yeah, if you can figure out how to put a 9 pin tube in a 12 pin socket!

The 6LF6, 6KD6, 6LR6 and a couple other tubes will work (you can also put another number in place of the first "6" for filament voltage) provided you rewire the sockets.

The EL-509 from Svetlana is a 9 pin tube, though, and has larger than normal pins, necessitating changing out the sockets anyway, if you want to do a proper job. I use it to replace the 6LQ6 / 6MJ6 / 6JE6 tubes, but even that is not for the amateur to do.

>
> If more than the filament voltage needs to be changed, what are
> the other changes, please?

1. Change the plate inductor to make up for the difference in output capacitance of the tube.
2. Rewire the socket to accomodate a different type of tube.

In a nutshell, you build a new linear for the substitution you are talking about, using the plate and power supply components existing.

>
> What sort of average peak SSB output should I expect? Not
> momentary whistle or shout swing but solid voice output power?

For the EL-509 look at 100 watts per tube PEP on AM, 100 percent modulated. That works out to 25 to 30 watts of carrier each.

On SSB, double that.

>
> I am also told that the 6KG6A/EL509 tubes run about $20. each,
> anyone have a better source if I buy 4 or 8 at a time?

20 bux a piece is chump change by todays standards. If you can get a linear for those tubes, be happy...

I would suggest a two tube 572b amp, though..... Better tubes, more dissipation (a single 572b has more dissipation than the three EL509 tubes... Nearly DOUBLE!) and they are designed for RF, not audio.

>
> - Thanks! DavidC

Morse Code is officially DEAD. There will be no official monitoring by any government stations here or abroad. Technology has put this horse to pasture. In short, Morse code has outlived it's usefulness. My personal prediction is it will eventually be done away with altogether as a requirement for full HF privileges. IMHO, broaden the voice allocation bands and retain a portion for those who wish to carry on with their cw contacts. Personally, I could care less WHAT they do. I 'm a freebander. I know the risk and accept it. All you RF cops, save the flames.....it's water off a duck's back.

As said before I have no problem with its use on the bands or the right of either side to attack or defend the mode, use it on the bands or attempt to sell it to the rest of the newsgroup or to other Amateurs. It makes little difference to the rest of us on this side of the argument.

Nor did I contribute to you any of the statements in question. The problem is many pro code supporters like I said want to be able to sing it praises tell the rest of us why the mode has to be preserved but take exception if any one challenges those statements.

State what your think are the technical merits, push traditional use of the mode etc. Just don't take offense or try to limit the other fellows options or right to attack those statements and then claim when he does that he is trying to eliminate the mode from use on the bands.

Right. I will oppose any who suggest that we have to take an FCC exam while wearing Star Trek outfits. If you want to wear one, then fine. If you want to wear one while operating your favorite mode, then fine. But don't try to make the rest of us wear them.

Your probably closer to the truth than anybody here. Code will probably
be capped at 5 wpm due to international restrictions (tobe lifted at the
earlist possible WARC). No lectures, you know the rules, happy
thanksgiving.

I don't like buying refurbs, but that seems like the better choice of the 2 here. You could be baying 140 bucks for a smoked radio, or for one that has been cut up inside beyond hope. If I was in your shoes, I would go ahead and buy a BRAND NEW Grant XL from EXPORTSRUS or Coaxkid.com; or a Texas Ranger 696 from Coppe for 129.99. The TR 696 is a great radio and maybe even a little better than the Grant. They are all great radios but 130-140 for a used one seems a little on the high side.

It will be crystal swap. Digital readout will read off 2 mhz and power output and sensitivity may suffer somewhat unless retuned. No 'easy' chip mod., from what I am told. Compare the schematic of the 485 to the HTX10 and you will probably find a difference in mixing crystal complement. If you are interested only in sideband (is there any other mode?) then buy a HTX100 and do the LSB mod----they are going much cheaper lately now that the HTX10 is on the market. Just worked Sakhalin Island (Russia) mobile with my old HTX100 on 10 m 28.509 mobile tonight---not bad for a 100 dollar used radio with a 2 dollar antenna!

Think of this... if you are going to modify it, or have it modified... what is the point in buying new? Just something to take in consideration.

I would go with the Uniden Grant XL, an older model if you can locate one. Although the Cobra 148 GTL and Grant XL are VERY similiar, they are at the same time, very different.

Greetings!

Well, hopefully, this takes care of those problems you've had.

As Toll said, and perhaps many others, take the time to make a friend
and they'll reward you.

You're out $65 bucks, no big deal - stick around!

You, like many others, have got a bum steer at least once in their
life. But, I'm glad to know that problem has been fixed.

It may not be a bad idea to be a well informed consumer. Had we known
about your predicament *before* you bought the radio, you might have
found another radio eventually without the headaches.

Take some time to read about some of those "mods" that people post out
on the net for different radios. You'd learn how to undo it.

Maybe a book or two about radios can also help you be better informed
for choices you may have to make.

While Dancing with the Mouse on 24 Nov 1999 08:48:21 GMT, the Modem
interrupted with an MNI from "iceshark@aol.com (ICE SHARK)", and the
MotherBoard buffered this to Video RAM:

:+> I want to take this post to apologize to all the techs on this group. I took
:+> your advice and took my saturn to my local tech here in wash state. I was
:+> amazed at watching him find the main problem whitch was a cracked edge of main
:+> board splitting a trace. He fixed it along with some other hack jobs he said
:+> were typical of do it your self mod book techs. He showed me around the inside

>
>

There is little motivation to develop mods for FRS. The radios only go 1 mile under average conditions....two miles under ideal conditions.

Raising the power does not significantly increase the range and only drains the batteries faster. Moving Amateur gear from 440 to 465 decreases receive sensitivity. Finally, as you will discover quickly, nobody on FRS wants to chat with other folks outside their "group". It's all families keeping in touch at the mall or as they drive down the road. And if you're meeting them on an Interstate Highway, you are in range approximately thirty seconds. Big deal!

Besides, why bother with FRS mods when there is a companion radio service (GMRS) which allows outside antennas and up to 35 watts?

I am looking to get a new cb radio. I am trying to decide between a Uniden grant which is available refurbished from the uniden website for $132.00 and a Cobra 148 gtl which I can get pretty often at pawn shops for around $140.00. My question is which is the better radio. Maybe if I get it from a pawn I will get lucky and it will already be peaked.

Check out my ever changing classic video game trade/want list along with my collection here.

>
> THANKS

why should anyone pay for mods when all they have to do is enter "CB RADIO FREQUENCY MODIFICATION INFORMATION" into
Dogpile.com and get 8 to 12 search engines with multiple sites with pictures and text?
if you enter the specific PLL, most times you go right where you want to be.

Yo ProZac,

'round these parts you can get Times LMR-400 for less than Belden 9913. '400 has lower loss, a tighter bending radius and it doesn't suck in water like 9913. You can use the same connectors too. Another good one is the Cushcraft equivalent - about the same price with the same spec's as '400.

Most of the time around here though, at a pawn shop a $140.00 item can be bought for 90-100.00 cash. They also if you talk to them right will give you a short warranty on it. I was kind of leaning that way but I have not decided completely. I have bought 2 radios from pawns before and had very good luck, but maybe that may not be the way to go in this case.

I have been trying to get a contact in the us for about 4 years now and the reason that i havent is because wen the skip is running from the us there is always someone on 27.555 playing music usualy using 1kw power, I thought that you guyes kept that sort of thing to freq 26.965-27.405 (our equivilant is) 27.60125-27.99125 and if i do find an op that is on another freq or can get over sed musician all thay are doing is bad mouthing the AT group (whats wrong with them?)

I know that as usual its only a bad few that give the rest a bad name (unfortunatly thay are the only ops I can here)

Davie 108 RI 041

P.S. I am not a member of the AT as I am a comitty member of my group but thay have all been very friendly with me.]

P.P.S. I apologise to the ops on this group who do not fall into this catagory.

I can feel the heat from here (flames flames flames)

I disagree. No wait means production is where it should be.

>From: "Þ®özå©625™" That is exactly what IM saying! And if they are busy and still filling orders they are throwing rush jobs out the door is that what you want?<

I disagree with this also. Just because guys work hard to keep up with demand, doesn't mean they're "throwing rush jobs out the door". I have had over two dozen units pass through my hands, and not one defect.

To bad the judge doesn't know what he is doing. rec.skiing.alpine is
NOT and Internet "site." The Usenet newsgroup rec.skiing.alpine is
basically a network path that leads to many thousands of privately
owned disk drives, the owners or which have the right to put whatever
text they want on them.

This is ridiculus....

I can't speak for customers or suppliers, but the technology has been around for decades. If you'd like to claim he spent several years learning, and used his education and ambition to start his own company building a product to his standards, then that would be an accurate statement.

>I am assuming he is not needed now ? perhaps #12 is now on the payroll.<

123 is an integral part of X-Force, and always will be. "#12" as you call him, is not nor has ever been a part of X-Force for monetary gain.

Sounds like a lot of coveting, rumor, and gossip going on around here.

Get a firestik an drill a small hole on the edge of the rear bumber.
The firestik can be hard mounted right into the hole with a bolt going
on the underside. Put the antenna on the side of the bumper that
allows you to open the tailgate. When you mount the antenna, make
sure you have metal to metal contact betweent the base of the antenna,
and the metal bumper. Then, you can run the coax from under the
bumper into the cab through any hole you find.

You've reached a new milestone in unrealistic "cause and effect"
scenarios. Do you expect anyone to believe that because the ARRL Board
voted not to support a code-free class of license that the FCC punished
amateur radio by taking away part of a band? Coincidence? No,
absurdity.
You HAVE been reading 73 Magazine as your only source of amateur radio
news, haven't you?

You claim that Morse testing is outdated is under debate. I don't
believe it is outdated. Many others don't believe it is outdated. If
we all accepted your view, there would be no debate at all.

> A "modern" reason. Ok, with the advances in communications technology
> (Which was developed outside of ham radio while hams relaxed in their

You now have a problem with DXers/DXing? You believe that all hams are
DXers? You believe that all hams have easy chairs in their shacks?

> it is no
> longer necessary to use CW, in all but the absolute extreme conditions.

Necessary? It isn't necessary to become a radio amateur. It isn't
necessary to have turkey on Thanksgiving.

> Since there is little that CW can give you over other digital modes or
> voice, and that there are so many modes that a prospective ham may
> choose, it is no longer necessary to know morse to operate a ham radio
> (This is not the 1920's).

Thanks for pointing out which decade it isn't--Damn, I have to get some
new calendars! CW is a mode of common use. Many amateurs cannot or do
not operate any other mode. An HF license permits you to use the mode.
Use of the mode requires some skill. The need to demonstrate that skill
is mandated by an international agreement.

> Note that the key word is "necessary". What
> you CHOOSE to do, is your own business. But it's not right that a few

> order to play with their latest digital QPSK or QAM project, on the air,
> that they have to learn an archaic telegraphy skill first.

AM, SSB and FM are old modes too. Are you advocating that we use only
modes developed after a certain date? Prospective hams desiring to
"play" with their QPSK or QAM projects on HF need to pass a morse test,
as "archaic" as it seems to you. I can just hear you speaking to your
history teacher, "Why do we have to learn this history stuff? It's
archaic!"

> This stubborn dogma is what's killing ham radio. If we can't let go of

> from now. But to do that, we have to move with the times.

There is no evidence that amateur radio is on its death bed. It is not
necessary to dispose of the past in order to move forward into the
future. That is simply flawed logic on your part.

> No one is suggesting that the usage of CW be discontinued, only the
> requirement for having to know it, to be changed. It makes little sense,

What CW bands? Those on 6m and 2m? You say that the use of CW is not
being challenged yet you continue to use terms like "archaic" and
"outdated" to describe it. I can't speak for others but when I read
your words, I find you less than genuine.

>

(26) Assorted 6BQ6/6CU6 sweep tubes, USED / TEST GOOD - $20 ALL

(16) Assorted 6DQ6/6GW6 sweep tubes, USED / TEST GOOD - $ 25 ALL

(5) Assorted 12DQ6 sweep tubes, USED / TEST GOOD - $15 ALL

All of these tubes have been tested on a B&K 667, and I have verified that they all test strong, have no grid emission/gas/leakage, and have no shorts.

I have tons of other sweeps (6HB5's, 6JE6/6LQ6's, 6JS6's, 6KD6's, 6LF6's, and lots more). Some are NOS / NIB, some USED / TEST GOOD. For the complete list, go to;

Hi all,
I just picked up a Connex 4800 DXL and I was wondering if anyone had one and your general feelings were i.e. problems etc.
So far I'm happy with the radio it talks very well and the freaq coverage of 24.265 - 29.655 is nice

Dave

This radio is of the 1970s vintage. Old. Not real good, but real good in its day.

4375. freq off on RCI 2950

Newsgroup: rec.radio.cb
Date: 1999-11-25 00:00:00 UTC
From: rjchen@leland.Stanford.EDU
Message-ID: <81j009deb1@nntp.Stanford.EDU>
Source record: 12760

Just got an RCI 2950 modded for 26-32. I noticed that its freq display is off by 200 Hz. The radio transmits 200 Hz below what it reads on the display, according to an external freq counter. I'm wondering if this is normal for this radio or is it indicative of a bigger problem (alignment, etc) that may need looking into?

Thanks,
-RC

> between pro-CW and pro-code test. I thought you were one of them.

Don't take out a couple of words from a sentence and than attempt to
twist the meaning of those words. A sentence is one complete thought,
not pieces of thought that can be ripped apart and attacked
individually. I clearly established the meaning of "pro-CW" in that
sentence when I used the words "code test" and "side."

The words "code test" clearly means that this sentence was talking
about the code test debate. The words "pro-CW side" clearly shows that
I was talking about those on the pro-CW side of that debate.

And, since that was the very first sentence of my message, and I used
the word "test" in that message many times, it is obvious that my entire
message only talking about the people involved in that code test debate
(not CW users in general).

All this is reinforced further by the fact that I was responding to a
message about the code test debate.

Now, I'm sorry, but if you cannot see that, you obviously need to take
some serious classes in reading comprehension.

Good day, Jones. I'll ignore the rest of the pompous, self-righteous,
garbage in your message.

Much of the stuff I described happened years before the 'feds' paid
any attention to BBS services, and on BBS'es that offered no
controversial subject matter. However, like you suggest, I'm sure the
situation is even more common now that the 'feds' are occasionally
paying attention.

Perhaps you misunderstood what he wrote, Tim. Nowhere in his message
did he say anything about "dx groups," or callsigns from "dx groups."
He wrote about "SSB Operators either operating in the 40 channels or
Freebanders." And he wrote about searching for a "27 MHz station" on a
database. But, again, he did not write anything about "dx groups," or
callsigns from "dx groups," in the message I responded to.

>
> To operate your equipment, you MUST have a license IN YOUR POSSESSION.
>
> Toll Free

Not true, Toll. The rules changed several years ago. You do not need to have a license in your possession to operate your equipment. You must have a valid callsign, listed on the FCC database, to operate equipment in the Amateur radio bands.

New operators, for example, may begin operation as soon as their callsign appears on the FCC database. They do not have to wait for the actual paper license to arrive by mail as they did in the past.

Today, the FCC considers its database to be the final word when it comes to who has a license - the paper license itself is not longer valid proof for the FCC. At this point, the paper license is only evidence of a license for those outside of the FCC.

hi davie, you and i are friends from icq but i must say if youve not made a contact in 4 years theres a problem on your end. maybe the antenna is too low or your power is but its something. we hear 108 division stations a lot hear and work them too. the AT group is not taken too well here in the USA simply because we have a different mentality than the european dxers. we dont enjoy groups with too many rules and always trying to tell us what to do. here in the states people are way more independent and just as likely to use a made up callsign as one from a large group. the only question i have for you is if 555 is too busy why dont you try calling on 26285 usb? this would only make sense since its fairly active and the qrm is almost always lower. good luck dx'ing.

Message-ID: <383d3ae8.40705237@news.iserv.net>
Source record: 12775

Greetings!

Well, there are a lot of "Techs" around here.

Flat River has a good one. [Greenville]

As far as GR-proper, there is only Power Unlimited. They contract out.

Talk to Bear or Brian.

Others, on the CB, are "Pirate", "DC" and "Six-Mil" - they only do this stuff on the sidelines.

Since late 1996' theres been a lot more appliance operators and fewer "Techs".

Myself? Don't ask. [I'm not trying to be mean - just realistic.] I don't mess with radios enough to really be called a "Tech" except when it comes to a particular chassis' and I'm pretty much a Uniden Fan because of the experience I have with them.

My best advice would be to try and learn this stuff on your own. I'm not kidding on that. If you need to take a radio in for repair, many simple things can be avoided a huge cost by simply replacing the part yourself and be done with it.

Because of advances in electronics, the older parts to keep radios from the late 70's thru to the early 90's have to scavenged from other "junker" radios. SMT and SMD devices are too new to have adaquate catalog-reference or even standards.

Radios with SMD/SMT technology from just a few years ago are going to be harder to figure out due to the out-dated cross reference and non-standard [at the time] part numbering. You litterally have to get a schematic to locate the value of the part or it's cross reference typing.

However, there is still support for the older IC's that can be found on the net a good place to go is...

http://www.rfparts.com

So, if problems do arise, or got some older radios that need fixing, take a look at whats wrong first, then decide to take it to a tech.

A lot of times a simple cap or transistor has failed, you just have to locate the part and replace it.

You take chances on "just brining it to a tech to fix" when you don't
know the parts that went out. This is where you can get taken.

I bought 2 radios from this guy that he had posted a few months ago.
A TRC-458 and a smaller RS TRC-441 base. The condition of the 458 was to say
the least.....HORRIBLE! If you do a search on his NG postings on DEJA.com
you will see when he posted them. They FINALLY arrived (after over 2 months
of shucking and jiving) in an UNPACKED egg carton.....no padding....just the
radios dropped in a large box with no peanuts or anything. E-mail me for
details on this guy if you have any questions. I rarely flame I person I
have bought something from but this guy is something else! At the very
least have him ship COD....you might not have to wait over 2 months for your
item.

When I key my mic to talk, lights on the radio dim a little. I just had new finals put in my Cobra 29 WXNWST. I am wondering if I can put a big capacitor parallel to the power input to supply the power when it needs it. Like they do to amps in car stereos.

Also my SWR is a little higher now, is that also because of the new finals.

Is there a board I can install myself for roger beep, I dont want it on the mic. I noticed some boards at bills2way.

The person who installed the finals said I had 7.5watts swinging to 50, what does that mean.

Thank you!

Most dealers have the common courtesy to include a printed copy on the modifications for the radio they are selling a customer without extra cost but some like to sell the books and make a little more profit off everyone. No reference to any named company intended, they speak for themselves.

hit the key to fast.

>When I key my mic to talk, lights on the radio dim a little. I just had new
>finals put in my Cobra 29 WXNWST. I am wondering if I can put a big
>capacitor parallel to the power input to supply the power when it needs it.
>Like they do to amps in car stereos.

Not sure about car stereo's but maybe a different power input. Sound like it
does not have enough amperage.

>Also my SWR is a little higher now, is that also because of the new finals.

SWR readings can change with higher dk. Thats all I will say about that.
Under a 2 your ok. It won't damage the equipment.

>Is there a board I can install myself for roger beep, I dont want it on the
>mic. I noticed some boards at bills2way.

Get one and try it. Have a very good soldering iron and don't use acid core
solder.
If you don't do it right, your local tech will be more than happy to redo it
for you.

>The person who installed the finals said I had 7.5watts swinging to 50, what
>does that mean.

Never mind, I was going to go into detail here, but it would not do me any
good. There is someone else who can fill you in. Don't want to risk hurting
anyones feelings on the NG.

==========
Can you back this up with any proof, my sources "which are pretty reliable"
say he has split and is now helping build the bulldog line of amps in
another part of the country.

> I can't speak for customers or suppliers, but the technology has been
around
> for decades. If you'd like to claim he spent several years learning, and
used
> his education and ambition to start his own company building a product to
his
> standards, then that would be an accurate statement.
==========
You are right you cannot speak about the suppliers and customers because
you don't have any idea of what exactly went on, and yes davemades
technology has been around for some time but it wasnt duplicated by any
other builder, certain ferrite mixes, tuning procedures, combining
tecniques are used by dave and no one elses even mirrored his and none
performed as well as his until 123 who spent "only 6/8 months working for
him" not years as you claim, left with his new found info. You should find
my statements to be very accurate I was only an arms length away from him on
the work bench and also a good friend of his .

>
> 123 is an integral part of X-Force, and always will be. "#12" as you call
him,
> is not nor has ever been a part of X-Force for monetary gain.
==========
I agree 123 "was" an intergal part if it wasnt for him leaving dave there
would be no x force, they wouldnt have had this knowledge. I guess we can
say the same about him and X force now. As far as #12, he wanted to help
the local x force guys, and make changes to the amp since they really didnt
know how to improve on a already great product and as we all know "#12" is a
very brilliant man.

>
> Sounds like a lot of coveting, rumor, and gossip going on around here.
==========
It is only a rumor if you don't know the real story. It is only gossip if

you chose not to beleive it.

VERY VALID POINT AND IS PROBABLY THE REASON NO ONE HAS RESPONDED TO YOUR POST. 1/2 WAVE MOBILE IS A HALF WAVE MOBILE UNLESS 55 IS NOW MAKING 5/8 WAVE MOBILE. IN THAT CASE IT WOULD BE BETTER AND I WOULD HAVE TO SEE THAT ONE.

GOOD POINT
I WOULD ASLO LIKE TO SAY THAT A DAVEMADE UNIT IS PERHAPS ONE OF THE
BEST AMPS ON THE MARKET FOR THE LAST SEVERAL YEARS. SOME PEOPLE DO HAVE
TO WAIT AND AS IT WAS SAID THEY ARE NOT A MOM/POP SHOP. THEY DO HAVE
MANY ORDERS. OF COURSE THERE ARE SOME GUYS ON THIS NEWSGROUP WHO CAN
GET AN AMP FROM DAVE IN A DAY OR TWO (AS WAS SAID PREVIOUSLY), THOSE
GUYS ARE PROBABLY GUYS WHO HAVE BEEN INTO DAVE AMPS WAY BEFORE THE
ADVENT OF THIS INTERNET CB AMP STUFF, HENCE THEY GET PREFERENTIAL
TREATMENT. EVEN WAITING FOR THIS PRODUCT SEEMS LIKE THE BEST THING TO
DO IN MY HUMBLE OPINION.

Phil do you have any idea (I am sure you do) what fixed vacuum capacitors cost ? lets see there are 2 @ 32 kv i'll leave the value out Call Surplus Sales. Then there is the machinist work, not sure that your used lathe can do the work of a cnc machine or as nice of a job, next a jig to bend copper the coil, the t-6 elements 1/2" are 12' long you would need 4 of them, the 3" diamter of 6061 would be needed for the mount, as well as 1' of delron which needs to be machined as well for the reflector mount. When this is pretty much all said and done you can now sit down and assemble the parts . Perhaps you like to work for free phil but i am assuming a small profit is included for time and the know how to do it.
Happy Turkey Day

4410. 8950 Substitutes - I'm Confused!

Newsgroup: rec.radio.cb
Date: 1999-11-25 00:00:00 UTC
From: DavidC <eDoc@netzero.net>
Message-ID: <s3qok3l7rrp13@freenews.remarq.com>
Source record: 12795
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.cb

I recently asked about substitutes for the incredibly costly
8950 tube. I found a discussion on DejaNews about this and
there was a suggestion that 6KG6A's are excellent.

I looked closely at the facts and there seem to be several
significant differences between the 8950 and all of the other
suggested substitutes. I don't understand how a 6KD6 or
6KG6 could be "forced into" a 8950 tube socket.

The 6KG6 is a Novar and I suppose the 6KD6 could fit in the
6KG6 socket but I don't think the 8950 is even close.

I think maybe folks meant that after the amp was modified from an
8950 to a 6KG6 one could substitute a 6KD6 for the 6KG6.

Can someone clarify please?

- Thanks again & Happy Thanksgiving to all! DavidC K1YP

I have 2 Connex 4800DXL radios. I liked the first so much I bought another. They both are LOUD and CLEAR on AM SSB AND FM. With a D104 these radios scream. I had them modded to key 2.5 and peak at 45. No limiters cut. I didn't like that notch on the course tune so I had it taken out. The freq. counter came a little off so I had it re-aligned. Good channel rejection and the receive is AWSOME. These are much better than that joker Delta Force radio that is talked about here once in a while.

What fraction of a T3? I work at an ISP, and my cable modem has
better throughput than DSL at a cheaper price. It can be sluggish
at times, but when the kids go to bed, it flies. I consistently
see 300kbs download and I have no uploadcap at this time.

I can listen to realaudio, surf the web and download huge mp3's
at the same time without noticing degradation. Can you beat $42.00/
month? DSL starts at $70.00/month for ADSL (residential).

Happy Turkey Day to all and to all a good turkey!

You are not required to have your "license" in your possession anymore,
the FCC Database is now acceptable, BUT, not a bad idea to carry a copy
since some LEO (not bright types) can't tell the difference between a
scanner or a handheld, CB, Ham or commercial.

I'm thinking about buying a handheld CB radio.
I found a new GE Model #3-5980 for $25
It looks kind of large, but most CBs are big.

Is this one any good?
Any recommendations of other brands or good deals out there?

The TITAN mobile is a 12W pep (no heatsink single final) version of the 4900 Magnum 257 & htx-10. The mod for the 257, Titan & 4900 is also in the ARTSCI "Radio Tech Modifications book" VOL 12B, under the Mag 257. (The HTX-10 has different chip that can't be "unlocked")

Carl you couldnt even spell ferrite before dan came to you , If this was the case my man how come you didnt have this technology before Dan gave it to you ,you should have been making these amps instead of buying them from dave the whole time. Hahah He got it from someone else, you can go around an tell people this but ask dan who sat there and watched him design his amps. He is a engineer unlike you he has forgotten more about electronics than you probably will ever know. You know you didnt get anything from Motorola you can't even read the book nor understand it what it says. You got it from Dave whether you like to admit it or not. So fuck You and the horse you rode in on. you screwed dan just like you screwed dave. in the end what goes around comes around.
While your at it prove to me whats in the Motorola Book Please list the pages, which version Motorola book you are getting this info from. So that i can find this info on. How come no other amp builders thought of reading this book before. Just you guys. Put up if what you say is true. Come up with something of your own like an antenna system thats not a copy of BB's or anyone elses. you should change your name to XEROX you guys can copy anything . I won't even say anything about the regulators. Hope you choke to death on a turkey leg.

I got an old 3 channel CB for $3 at a garage sale.
It has 2 crystals that are a labeled:

Transmit: 27.125Mhz
Receive: 26.670Mhz

What channel is this?
Is it 14?
Do most CB's use superheterodyne to require a
different frequency of transmit and recieve crystals?
Do they only superheterodyne only on recieve and
not on transmit?

Below is CB frequency table

Chan	Freq	Chan	Freq
1	26.965	21	27.215
2	26.975	22	27.225
3	26.985	23	27.255
4	27.005	24	27.235
5	27.015	25	27.245
6	27.025	26	27.265
7	27.035	27	27.275
8	27.055	28	27.285
9*	27.065	29	27.295
10	27.075	30	27.305
11	27.085	31	27.315
12	27.105	32	27.325
13	27.115	33	27.335
14	27.125	34	27.345
15	27.135	35	27.355
16	27.155	36	27.365
17	27.165	37	27.375
18	27.175	38	27.385

Wow! I think I am getting less confused ... a small Thanksgiving miracle!
;-)

Now, can anyone tell me from direct personal experience what tubes they
have directly substituted without mods for the 8950?
Results?

What tubes have you directly substituted for the 8950 with mods?
What mods did you have to do?
Results?

I'm looking at modifying a Palomar 12v Amp designed for one 8950 driving
three and wish to make the mod that generates the maximum output that is
distortion and garbage-free using the existing power supply (changing caps
or
other small components OK, changing transformers is not).

Thanks for all who have already offered helpful info! 73, DavidC K1YP

> There are many possible substitutes but I know of only 1 tube that will

>> $550 ?
Well you did make me eat my words.

I'm of the opinion that if you're in the manufacturing game then with
overheads one has to double one's money at an absolute minimum.

I take it this is a mobile 1/2 wave design?

Are the cap's to bring the feed impedance up to 50R?

I was unawares that one needed any capacitance on frequencies around
27MHz but I only have experience of loaded 1/4 waves where the chassis
is the other half of the dipole and only from around 14MHz and down does
one need shunt cap's or tapped inductor.

Can one drive down the street with these monsters on top or are they
strictly for shoot out use?

Phil / UK

There Are No Substitute's For The 8950 Mill Spec 8 Volt Tube....
Most Others Are Not Even 8 Volts
The 8950 Was A Mill Spec Sweep Tube Used In Several Amps Palomar, D&A Etc.
And The Siltronix Radio's In The Finals And A Few Others.
73's W5IDX
Good Luck.

> well how about posting the sites you already know

Well my favorite sites are probably the most well know site on the net.
There are many other sites I know of that I don't wish to plug.

www.angelfire.com/nj/earplugger Often updated Keeping the band all tied up
award. I think I like this site cause he is from NJ?

http://members.aol.com/davemade1
Some of the Dave Made Mobiles, and Hawaiian hall of fame. Also from NJ.

www.davemade.com more Dave made pictures

www.bayshorenetwork.com pictures of my stuff & new ones coming real soon. IM
also from NJ

These are the sites I frequent the most! But like I said there are many
other sites I know of that I don't wish to plug.

Please post your favorite CB sites.

As I said...just a thought. It would be interesting to know if the boards and other components are the same. I personally don't need too, and wouldn't mod my HTX-10. As for others, right now, you can still buy the modifiable radios. This may not be the case in the future...think about it.

Well, the original poster was next to a bear when he lit up his Ham
Radio and the bear evidently pulled him over. Seems Mr. Bear heard our
friend come through his radio (Probably cheap VHF). Bears are showing
more curiosity about radios lately. MY OPINION-more radio shenanigans
on VHF and UHF Police Freqs have made them wary. Your right, nothing is
illegal until caught as my pop said. However, bears aint't stupid. I
always use the CB for road info, I like to spend my $ on family not
supporting the local revenue enhancement scheme.

Dognottt@my-deja.com, why in the hell did you flame me through E-mail and not post your letter? Could it be because you accused me of being a "looser" (and, by the way genius, it is spelled l-o-s-e-r) because you are too ignorant to perceive that what I said is true? I did not slam any one or say anything about cw that could be misconstrued as negative. I simply stated that there is no official monitoring by government agencies anymore. I didn't disrespect cw, you fool. I guess it was the fact that I stated I was a freebander that got your little pink panties in a wad! I also never mentioned using an amp or a power mike for that matter, those were YOUR words, not mine. Don't worry about me having to pay a fine there, Einstein, because I am more than willing to accept any consequences that come my way for my actions. If you can't do the time, don't do the crime. As far as why I am not on a REAL computer (why in the hell this would concern you, I have no clue) is none of your business. But since you are such a nosy bastard, I'll pacify your whimsical, mindless, inquiry this one time. I don't know you from a can of paint, but I can deduce from your post that you are mentally deficient and in desperate need of education. I'll try. You think I would get out here and post from my home QTH and talk about freebanding and admit to it freely? Some may, I won't. Your ignorance precedes your reputation from here on. As previously stated, save your flames (or at least have half a gonad and post so everyone may read your pitied rhetoric) 'cause it's water off a ducks back. In this instance, you are the duck. MUD-duck! Quack-Quack!

>
> QRM
---------------->

I can't speak for the 2950 made in the last couple or three
years. I have an older 2950 that, once I put it on freq., has stayed
with almost no trouble.
One of the first things I did was unlock the clarifier so that
the tx would follow the rx. Then I realigned the unit.
I have used this radio in my big truck through all kinds of
temperature extremes without problem. I had only one problem with
it. It had an intermittent problem when the to-220 regulator IC had
loosened it's legs from the pcb.
The temperature changes only caused me to shift the clarifier
ever so slightly from center during temp changes.(Cab warming or
otherwise) And not being the type to worry about centering the
clarifier when I talk to someone, the slight offset from center
never bothered me. I just tuned to whoever I was talking with and
that solves the problem.

M2057.

> Results?

Works fine.

> What tubes have you directly substituted for the 8950 with mods?

6LF6, 6MH6, 6LX6, 6KD6, 6JS6.

> What mods did you have to do?

Filament rewiring and sometimes additional tank
capacitance. If you're using the tall versions
in an amp where the tubes are vertical, you have
to lower the board or chassis where the tube
sockets are and lengthen the plate leads. Some
of the amps where the tubes are horizontal
require mods to fit the longer tubes, and some
won't work with the longer tubes at all. The
long tubes are 5 inches long, and you need an
eighth of an inch of clearance above the plate
cap. The 6KG6/EL509 that's reasonably priced
is one of the tall types.

> Results?

They work fine.

> I'm looking at modifying a Palomar 12v Amp designed for one 8950 driving
> three and wish to make the mod that generates the maximum output that is
> distortion and garbage-free using the existing power supply (changing caps
> or
> other small components OK, changing transformers is not).

None of the sweep tube amps are especially clean, so don't
expect perfection when it comes to distortion. The crap
content in sweep tube amps is usually 5 to 10 dB higher
than in an equivalent ham amp that uses transmitting tubes.

The 6KG6/EL509 is the most powerful and is available for a reasonable price, but it also requires the most effort to make it work. The sockets have to be changed. They use European 9-pin sockets--not Novar sockets. You can force them into Novar sockets, but the sockets will never hold the thinner-pinned Novar tubes afterward. The 6KG6 is a tall tube; you have to make sure you can fit them in without shorting the plate cap to the chassis.

Personally, I wouldn't spend any money or time on a 12 volt tube amp. They're big, noisy, wasteful, unreliable, costly to repair, outdated piles in my opinion. I've had two 1-driving-3 sweep tube mobiles: a Palomar 310M, and a PAL 350MDX; I converted them both to base amps by gutting out the unreliable DC to DC power supplies and using 117CX Swan power supplies that are separate from the amp itself. The power supply connects to the amp through a jones plug (similar to the Palomar 300A design). With the stock power supply gone there's plenty of room for a fan to help keep the tubes from overheating.

If you're curious and just can't resist making that amp work, buy the cheapest tubes you can get ahold of, play with the amp until you've learned all you can, and then sell it for as much as you can. If the switching transistors in the power supply are still good, and you didn't have to pay too much for the tubes, you may just be able to come close to breaking even when you sell it.

If you need them, I have 6JS6As that will work in that amp (once you rewire the filaments) for $20 each. They are NOS, matched for gain (transconductance) RCAs in their original 1966 vintage boxes. The "A" version of the 6JS6 will produce as much power as an 8950, but has a lower plate dissipation spec. What that means is you have to be more careful when tuning the amp or the tubes will overheat. When tuning the amp for the first time you should have the cover off so you can make sure the peak power output happens before the tuning caps reach either minimum or maximum capacitance. In other words, you want to make sure you can see both sides of the peak before the plates on the air-variable caps (there is one in the driver stage and two in the output stage) are either fully meshed (maximum capacitance) or fully unmeshed (minimum capacitance). If you don't do that there very often is a false peak at either the minimum or maximum capacitace position that makes you think the amp is properly tuned, when in reality the output isn't at maximum and the tubes are overheating because they have to dissipate too much power.

Here's an applicable case history: I put a set of my
6JS6As in a Palomar Skipper 300. The Skipper 300 is a
1-driving-3 amp that is similar to the Palomar 310M
mobile amp. When tuning it for the first time I saw
both sides of the peak when tuning the driver cap, but
both output stage caps ended up at their minimum capa-
citance positions at what seemed to be maximum peak
(modulated) output. The maximum peak output was about
550 watts (measured on a powered, peak-reading meter
feeding a dummy load). I noticed that it only took
about 10 seconds of key-down time before the tube plates
began to glow. I knew the tubes wouldn't last long
running like that. I experimented with different
techniques to make the the output tank circuit (the
two air-variable caps and the coil in between them)
resonate with the caps near their half-meshed areas.
I didn't want to cut plates off of the caps, so I
tried other things. In the end, adding 30 pF to the
antenna load cap brought both caps back to near their
half-meshed areas. In other words, I could see both
sides of the peaks of both caps. The peak output
went up to 620 watts and it takes 2 to 3 times more
transmit time to make the tube plates glow. The amp
went back into service and the customer is happy with
it. The customer runs it on low (420 peak watts) to
keep the tubes cool and his neighbors happy.

> Thanks for all who have already offered helpful info!

You're welcome. I hope this helps.

For what you want to do you don't need a competition amp.
A good quality, biased (AB or B class), mass-produced amp
will work fine for multi-mode (both AM and SSB) skipshooting.

Personally, I like the XL-series, Blue Face amps. They
have features that you have to pay extra (and usually have
to wait) for when ordering a competition amp such as Dave Made
or X-Force like an independent pre-amp, switchable SSB delay,
bias, and output filtering. They are in-stock and ready to
ship at all the popular on-line CB amp distributors. If
you really want low cost and low current draw, you can look
into the Blue Face 80s and 225s. The 80 doesn't have any
extra features, but it is biased for SSB and it has some
output filtering. The 225 makes twice as much power and
has more features for less than twice as much money. And,
since it has 3 power levels, the current draw is adjustable.
On low, its current draw is around 5 amps. The Blue Face
225 is the best bang for the buck amp for what you want to
do (in my opinion).

Can you back this up with any proof, my sources "which are pretty reliable" say he has split and is now helping build the bulldog line of amps in another part of the country.

>>>I can. Talked to the people this week about going to Memphis.

>>>123 is still their.

>>>123 has also been helping Sludgehammer build those amps for quite some time, although Sludgehammer has been building them for longer than Danny has been doing X-Force.

You are right you cannot speak about the suppliers and customers because you don't have any idea of what exactly went on, and yes davemades technology has been around for some time but it wasnt duplicated by any other builder, certain ferrite mixes, tuning procedures, combining tecniques are used by dave and no one elses even mirrored his and none performed as well as his until 123 who spent "only 6/8 months working for him" not years as you claim, left with his new found info. You should find my statements to be very accurate I was only an arms length away from him on the work bench and also a good friend of his .

>>>So?

I agree 123 "was" an intergal part if it wasnt for him leaving dave there would be no x force, they wouldnt have had this knowledge. I guess we can say the same about him and X force now. As far as #12, he wanted to help the local x force guys, and make changes to the amp since they really didnt know how to improve on a already great product and as we all know "#12" is a very brilliant man.

>>>Dennis also offered his help to Dave in the past, and was either ignored or refused.

>>>However, one of the things that DaveMade bagged on X-Force for was them having Dennis help in the beginning.

One of the builders that worked for Davemade went out and started building the
X Force line. They were at first the same RF Deck, but now there has been
changes made to the RF Deck. Both product lines work very well.

The 2950 does not hold frequency very tight, especially under various temperature conditions. You can tune it back on frequency with internal controls, but it won't stay.

> finals put in my Cobra 29 WXNWST.

This is because your radio is drawing current and the resistance of your power leads is actually dropping the voltage a little when you transmit. I would check that the connections to your battery are good.

> I am wondering if I can put a big
> capacitor parallel to the power input to supply the power when it needs it.
> Like they do to amps in car stereos.

This is a waste of time (and a waste of time with car stereos too if you ask me).

> Also my SWR is a little higher now, is that also because of the new finals.
>

The VSWR should not be affected by the output power. It is a relative reading. It could be that the extra power is making your VSWR meter read more accurately as it is working with higher voltages now.

> Is there a board I can install myself for roger beep, I dont want it on the
> mic. I noticed some boards at bills2way.

I can't comment on these boards 'cuz I don't use them and don't normally talk to stations that do.

> The person who installed the finals said I had 7.5watts swinging to 50, what
> does that mean.

I'm sorry, but I don't agree with the concept of "swing" on AM radios and the method of measuring the power of "swing" is inherently flawed.. Basically, your mechanic has bastardized the radio such that it will over-modulate like crazy. A lot of people find it hard to believe, but when you run your radio with 100% modulation you can talk farther than 150%. I know it is hard to fathom, but it is true. Wildly "swinging" radios sound louder to the locals, but much of your signal's energy is wasted in harmonics that won't be heard by anyone.

Unlike you Dennis, I'm not putting Dave down, nor you. I think it's great when someone takes a basic design and makes it better. That's what Dave did, and that's what Dan did. It's sometimes called OTJT, on the job training. You study, you learn, and if you have ambition, you go on your own and improve.

>> 123 is an integral part of X-Force, and always will be. "#12" as you call
>him,

Well I asked a question about a rumor I heard and I stand by what was told to me by a reliable source as private as these matters may be to some others have no problem about talking about dave and any part of his business why is this any different? >
>
>Unlike you Dennis, I'm not putting Dave down, nor you. I think it's great >when
>someone takes a basic design and makes it better. That's what Dave did, and >that's what Dan did.
==========
Unlike me?, I am not putting dave down either, I didn't put anyone down but asked a simple question if 123 has left x force. but the owner of x force quickly replied to and he didnt deny it in the least. Your comparison of the 2 arent even close Dave did not go to wok for someone and leave with there design and confidental info. Dan has not improved anything in my opinion, I have seen some of the latest secret battle boxes he builds a good clean amp ,as far as the class b bias it is not a big deal nor a new revelation. Please don't put Dan in daves electronic class they are not even close now I like danny but he is no dave when it comes to rf and electronics.

>Dan still "IS" X-Force
i have heard otherwise

>#12 offered to help. Do you think Dave was born with the information he >posesses now? Come on Dennis, give this >a rest.
==========
No i know he wasnt born with it he learned on his own accord by trial and error. He used to modify Texas stars and TNT, his amp looks nothing like these do. But if you ask xforce 151 anyone can pick up a motorola book and make a amp that compares to xforce or daves its all in there, he said it was. I just want to know why it took 123 to go to daves and leave before anyone thought of this idea.I asked a simple question what happened to 123 and now a few x force guys come out and make a big deal about it. I don't work for dave so why is it a problem to ask these questions? Double Standards?

>I'm of the opinion that if you're in the manufacturing game then with
>overheads one has to double one's money at an absolute minimum
---
I agree, hard to in cb game with lots of competiton and people using your
design and not inheriting the cost of r&d that you had put into it

>I take it this is a mobile 1/2 wave design?

Yes sir.

>Are the cap's to bring the feed impedance up to 50R?
>
Yes Phil you need to introduce some capacitance, it is also a tapped inductor

>Can one drive down the street with these monsters on top or are they
>strictly for shoot out use?

strictly for stationary skip talking ,shootouts about 200 inches in height for
the driven element . Hope this helps Phil any further questions e-mail me ill
be glad to talk to you about it

This was really directed at Dwight Stewart. The part about the
5 year old Texas Star was aimed at someone who mentioned that
Star's don't hold up. I believe Tim's 112 DXCC contacts because I
have talked all over the world on my CB. Happy DXing.

Yes it is 14 26.670+.455 if freq.
Older radios that used a crystal for each channel did not do any mixing for
the transmit.

Yep, I have a Macintosh. I did some thinking about this after reading your message Scott, and I realised that I do have software like this in my computer. ClarisWorks, which I use for everyday stuff, has a pretty good telecom module built in.

In the past, I used a program called ZTerm. It's probably the best software of this type for the Macintosh.

programmers have already made the y2k mistake all over again. Numerous
times.

A good example, the ubiquitous UNIX implementation with 32bit second
clocks. This is basically the same problem all over again, a date rollover
that screws up all subsidiary date functions.

doesn't have nuttin' tu du wif CB, untill they start putting
microcontrollers in them. BIG TYME! hi hi (like those ham rig conversions)

BGB wrote:
>i have heard otherwise

I've answered your question. You may have "reliable" sources, but in
conversation with the man in question, you have heard wrong.

Warlok wrote:
>>Unlike you Dennis, I'm not putting Dave down, nor you. I think it's great
>>when
>>someone takes a basic design and makes it better. That's what Dave did, and
>>that's what Dan did.

BGB wrote:
>Unlike me?, I am not putting dave down either, I didn't put anyone down but
>asked a simple question

You've been dogging Dan since he left. He's not in here dogging Dave for
stealing Motorolla's design, Texas Star, TNT

BGB wrote:>Dave did not go to wok for someone and leave with there design
>and confidental info. Dan has not improved anything in my opinion

I don't know who Dave worked for. As I said, he wasn't born with an electronic
degree. You don't just dive in and start changing/innovating a design without
some knowledge from education

BGB wrote:>Please don't put
>Dan in daves electronic class they are not even close now I like danny but he
>is no dave when it comes to rf and electronics.

I didn't put Dan in that class, but that doesn't mean he couldn't be. Dan is
young still, give him time. Those of us whom love radio and rf, will forge
ahead looking for something new, something better, and how to get it done. Dave
is not the Lone Ranger
nor Bill Gates. I respect Dave for what he's done, and Dan (123), Toll
Free,Sean, Dennis(12), Carl (EFJ), John (SledgeHammer), BlueGill, 2Watt, Muddy,
and on and on.
Your hangup with "copying" is monotenous <sp>, Dave copied, Armadillo copied,
cookie copied, hell, nearly everyone copied something and then personalized or
improved or both.

Gees Dennis, put it behind you already.

>I asked a simple question what happened to 123 and now a few x force guys
>come out and make a big deal about it. I don't work for dave so why is it a
>problem to ask these questions?

I thought you did work for/with Dave, hmm, guess I missed on that one. That must make you the Dave cheerleader. I'm not an "X-Force" guy, I just like the people that build them, how they operate, how they care about every customer no matter how large or small. They don't have the "bad attitude" you get from alot of Dave dealers or distributors.

Hello David: Here is a web site with a great amount of Beam antenna assembly instructions, parts descriptions, and part lengths.

http://www.majestic-comm.com/maco/support/index.htm

I would suggest caution in trying to make the antenna your self. If its your first time, I would look at all the antennas at the noted site, and look over the the ARRL Antenna Book. There are computer programs the will show how the antenna will work, without assembling it. I use Eznec.

Another thing you will run into, is that the aluminum tubing, run around and tuning time will cost more that the ones already available. Then the next consideration is how to install the beam antenna without it coming down in the next high winds.

Hey toll I dont know who Dave works for but I saw something with my own two eyes that cant be found in the bird cat. or any other cat. It is all printed circuitry and from what I hear it is daves work. Is it bull shit? dont know but I saw for the first time from them.
You program which slugs you are using it reads forward & reflected power and SWR.

I really dont know what the deal is with these things because they are not advertised so I might even be pissing them off by talking about it I don't know.

I listen in on channel 11 and 19 a lot and I got a fella in Texas and I'm way up here in New Jersey with a tiny GE hand-transciever. Hope you had a nice Thanksgiving.

<< I took my little 4x4 down to my friends farm. On the way, my little 5 year old 2 pill Texas Star was heard in California! The River Rat in Southern Cal heard my little TRC-422 with a Uniden Stock mike! With my KW-7 Firestik on the back bumper, I was talking all over the place. If anybody heard me reply here. Conditions were awesome today.

BTW, I heard Mod Squad a few days ago on ch 11. He was booming! >>

It is a similiar concept to birds but has no resemblence whatso ever other than them both being digital and being able to read a 30 or 100 micro amp slug. Birds sells them for $1200.00, his sells for under $300. He also has been making computer controlled digital dashboards, tach,oil,volts etc for the local drag racing scene. This is where this idea came from I should know I suggested the digital watt meter idea after seeing the digital dash

No he is not working for Bird now But he has design some work for coaxial dynamics. He has made his own digital reading watt meter that can be used with bird or coaxials line section. It is computer controlled whereas he wrote his own software for it . It is the same as owning a digital volt meter Fluke makes them so does that mean that the ones radio shack sells are the same inside.

Pardon my ignorance, I am but a lowly newcomer to the ways of the transceiver. I keep reading these posts concerning a "pill." Can anyone enlighten me?

I posted concerning my swr's a couple of weeks ago. I was able to solve my problem with a Wilson fiberglass whip. I must admit that I am very impressed with this antenna.

Propagation has been great this week. Spoke to Oklahoma from our West Virginia valley.

The ultimate measure of a man is not where he stands in moments of comfort and convenience, but where he stands at times of challenge and controversy.

> You've been dogging Dan since he left. He's not in here dogging Dave for
> stealing Motorolla's design, Texas Star, TNT

Again I ask you or anyone on this NG to show me where dave has copied or used Motorolas design. Prove what you say to be true Don't talk me another asshole prove it. The fact remains you cannot. Show me where his amps resemble TX star at all or tnt you are using words that I said about him modding tx star and tnt to his own specs It is a proven fact x force used daves design wrap for wrap, cap for cap, Why would you argue they did not. This guy builds plasma generators, Broadcast transmitters I guess he copys them to haha. what a joke

You are right you don't know he is basically self taught and has no electronic education other than a street degree

>
> I didn't put Dan in that class.

As much as I like dan he is not, nor am I and I don't claim to be, I don't claim to have bettered his amps either but I could build one as good as dan can.

,

I like one of the guys that builds them too Dan, I don't like how they operate they will fuck you in a minute if it is for money or to sell there amp. So I guess you can blame dave for his dealers attitudes he may sell them amps but attitudes are not his specialty

The term Pill is used for the transistors used in CB amps. Such as the 2290 & the 2879 transistors by Toshiba. And also some MRF and other types. They look like a big white pills.
A 16 pill = 16 2879's, A 5 pill = 1 2290 & 4 2879's

Well if you think I came on here to mess with people or mess with your so called bandwith your crazy. That was the first post I had ever posted on this board. I posted that the day I found this board. I just wanted an answer if there was one. Not get the whole board fighting. I also stated that I knew nothing about cb's. Dont know what other info you wanted on me. Im a beginner and no nothing. It's that simple. But im not trying to make this into a fight in any way. Just want to let everyone know that the post was legit. I have better shit to do then try and "jerk someones chain". I figured if someone didnt think it could happen or didnt have an answer they wouldnt bother posting. Only the people that thought maybe they did have some positive input on the post. But I found out on here it doesnt work that way. If i made anyone feel like I was just trying to waste peoples time then im sorry.

My website has tons of FRS infoo... including a comparison between FRS
and CB. It is perhaps better you look over all available info before
making your decision.

FRS uses UHF FM.. which has better sound quality. FRS allows use of a
subaudible tone squelch to prevent you from hearing unintended
communications.

From: rjchen@leland.Stanford.EDU
Message-ID: <81n54abmr1@nntp.Stanford.EDU>
Source record: 12976

1. Can the beep that accompanies the pressing of the buttons be tunred off?

2. The sensitivity seems good, but the S/N and NL are a bit weak. Any way to improve these via mods or in-line noise choppers and such?

3. How can the AM mod limiter be disabled while leaving the SSB AMC intact? According to the tech who worked on my radio, this is what he did, but I just want to know exactly how he did it...

4. Finally, what kind of power output should I be seeing in a peaked radio? Currently, I have 2-10 watt deadkey on AM swinging to about 35 max. SSB varies from 15-25. I'm wondering if I should tweak this further...

Thanks,
-RC

Greetings!

No not wrong, just displaying the symptom.

A lot of times a full blown squeal starts out as a low frequency
oscillation - which occurs more often than many people think. They
just don't hear it because it's below the bandpass filters the radio
uses.

Kinda like a 60Hz hum, and gets worse as the volume goes up.

Many cases of this problem, it's like a relaxation oscillator that
"winds up" when resistance feedback path goes lower. Turning into a
full blown high-pitched squeal.

Good point thats worth mentioning.

60 Segment S/RF meter
5 Memory Channels
RF Gain Control /Microphone Gain Control
Noise Blanker Frequency Scan
Last Channel Recall
Split Frequency for Repeater Use
Receive Audio Tone Control
Scanning Microphone
1 Year Warranty

Receiver Specifications

Circuit Type Double-conversion Super heterodyne
Intermediate Frequencies 1st IF: 10.695 MHz
2nd IF: 455 kHz
SSB IF: 10.695 MHz
Sensitivity SSB/CW (10 dB S/N): 0.25 uV
AM (10 dB S/N): 1.0 uV
FM (12 dB SINAD): 0.3 uV (-135 dBM)
Selectivity SSB: 4.2 kHz/-6dB
CW: 8.5 kHz/-60dB
AM: 6.0 kHz/-6dB
FM: 18 kHz/-60dB
Adjacent Channel Rej. Better than 70dB
IF Rejection Better than 80 dB for all frequencies
Freq Response 250 - 3000Hz
Clarifier Range 1.5 kHz
Audio Output Power 2 watts minimum at 10% THD w/8 ohm load
Audio Output Z 8 ohms

The remote RF deck is the power plant of the Magnum 357DX. Separatingg the RF deck and the Control deck increases performance and reduces the chance of RF interference. The Control and RF deck are attached by a 9" control cable with computer-type connectors.

Yeah well toll knows all so why argue?

I have forgotten more than your 60G education taught you.

For shits and giggles, why don't you bother telling us what the BGP4 routing protocol is, and how to impliment redundancy through it, and how to keep a firewall system running utilizing BGP4 and multiple internet routers?

That is an elementary question for someone who is as good with computers as you are.

Kenwood never made a plate modulated radio..

They where all either low level modulated, or screen grid modulated.

Therefore, the Tram will blow it away. Put an amp on the Tram to get the power levels about the same, and both running correctly, the Tram will eat it for lunch.

Hate to say this, as I run a Kenwood.

> It is a similiar concept to birds but has no resemblence whatso ever other
> than them both being digital and being able to read a 30 or 100 micro amp
> slug.

Yes, we all know that their are so many ways to make a digital voltmeter, right?

Geeze... The point was to let Prozac know that he doesn't need to be on the ballsack.

Dave is not a God. Dave did not "invent" the idea of the digital meter. He may have a good design on amplifiers, and have a decent wattmeter.

Birds sells them for $1200.00, his sells for under $300. He also has
> been making computer controlled digital dashboards, tach,oil,volts etc
for
> the local drag racing scene.

So does VDO... Does this mean that he copied them? After all, they are all just digital voltmeters, and the sensors send a controlled voltage back to the indicator. The indicator is programmed to respond to the change in voltage in different ways (speedometer and tach via rate of pulse, the others via change in voltage).

Dave in no way invented this. Although he may have made it cheaper.

The point is, Dave in no way came up with something new.... Neither did X-Force. Neither did Bulldog.. Neither did Texas Star (with the Skeleton).

Hell, I have a Palomar TX150 that will run at 18 volts... Nicely.

It was built before Dave was around.

Does that mean that he copied it? No, it doesn't.... What it does mean is that he found another means to an end. Any of the 70s class C palomars and markos, etc.... will run at higher than normal voltages.

If Danny and company copied the design... Who gives a flying fuck? It was bettered (as the Dave boys point out, time after time, by #12), but not after he offered the same help to the Dave crew.

Before X-Force was on the "hit list", "Shit list" or whatever else, it was No-Name.

Everyone has to have a bitch about something.

The consumer bitches about DaveMade taking so long to get a product to them.

The DaveMade people bitch about people "stealing" their design.

See the justice?

So everyone should just quit bitching. If you want a DaveMade amplifier, buy one and wait. If you want an X-Force, buy one of them and get it in a few days.

Concrete Man out here taking up bandwith rehashing shit that Danny did is just getting plain old. Just like the rest of the arguments about this subject. If you want to know what happened to Danny, call him up.

>This is where this idea came from I should know

Great. You will also remember when you guys where testing the Viagra antenna system on your truck, I told you how to build a remote field strength meter. You said that it was the same as Daves (in theory).

Guess I copied his? Although one was never sold to me?

I am not trying to be a dick, Dennis, I am just tired of the wasted bandwith and the same old shit being dredged up every couple weeks.

4618. Going out of business

Newsgroup: rec.radio.cb
Date: 1999-11-26 00:00:00 UTC
From: EXPORTSRUS <anonymous@cotse.com>
Message-ID: <199911270358.WAA20101@cotse.com>
Source record: 13053

I'm sorry to announce that Exports R Us will be be shutting down on December 1st. I've decided to do this because I can't live myself anymore. I can't continue to rip people off by selling them refurbished radios and previously blown up repaired amplifiers. I'm sorry for defrauding people out of their hard earned money. I also would like to say that Dave Made amps are better than X-Force. I was only trying to make quick money and didn't give a damn about quality. Rich

> right?
>
>
> Dave is not a God. Dave did not "invent" the idea of the digital meter.
He
> may have a good design on amplifiers, and have a decent wattmeter.

Never said he was. Never said he invented the idea of the digital meter,
just that he is designing his own digital meters. See its the same with
kenwood,Yaseu,Icom they all make amatuer radios that will basically do the
same thing but each has engineers that design there own version based on
what they feel will work. Some work better than others but Did any of them
invent the radio? Or its idea.
>
>
>
> So does VDO... Does this mean that he copied them? After all, they are
all
> just digital voltmeters, and the sensors send a controlled voltage back to

> voltage in different ways (speedometer and tach via rate of pulse, the
> others via change in voltage).
>
> Dave in no way invented this. Although he may have made it cheaper.

Never ever heard me say he invented the idea of a digital dash, other than
he designed his own digital dash, and the accompanying electronics

>
> The point is, Dave in no way came up with something new....
Neither did
> X-Force. Neither did Bulldog.. Neither did Texas Star (with the
Skeleton).
>

> Hell, I have a Palomar TX150 that will run at 18 volts... Nicely.
>
> It was built before Dave was around.

So?
thats one of your lines hehe
>
> Does that mean that he copied it? No, it doesn't.... What it does mean
is
> that he found another means to an end. Any of the 70s class C palomars
and
> markos, etc.... will run at higher than normal voltages.
>
> If Danny and company copied the design... Who gives a flying fuck? It
was
> bettered (as the Dave boys point out, time after time, by #12), but not
> after he offered the same help to the Dave crew.
==========
I have yet to see any improvements by #12 that have made a difference in the
comp amps. Again he offered to do the warranty work, he was not needed for
anything else.

>
> Before X-Force was on the "hit list", "Shit list" or whatever else, it was
> No-Name.

No it was cookie, remember his were taking over the market . Noname hasnt
been a threat other than on he web boards

> Everyone has to have a bitch about something.

And your No different.

>
> The consumer bitches about DaveMade taking so long to get a product to
them.

---
ask Ice cold how long it took him to get his amp 2 or 3 days hmm some wait.
Why do you think there is a wait because nobody wants them.

>
> The DaveMade people bitch about people "stealing" their design.

Stealing the design, where to get the parts and names and numbers from a
customer base may not seem like much to you. But saying it is in a motrola
book and that this is where he got it is complete bullshit.
>
> See the justice?

Not really

>
>
> So everyone should just quit bitching. If you want a DaveMade amplifier,
> buy one and wait. If you want an X-Force, buy one of them and get it in a
> few days.

Again I think Ice cold and Programbo got theres in less than 5 days from
what they have said in other posts

>
> Concrete Man out here taking up bandwith rehashing shit that Danny did is
> just getting plain old. Just like the rest of the arguments about this
> subject. If you want to know what happened to Danny, call him up.
-=---

Toll I asked a simple question about a rumor I had heard from someone who i
feel is giving me true information and that I still stand by is true. read
it

" Is it true 123 the is no longer affiliated with X-Force this is the
latest
news i have heard, since 123 was the main man behind x force getting there
start he brought davemades technology, customers, suppliers etc with him.
I am assuming he is not needed now ? "

So check the posts after that and tell me who started the rest if people
don't like what I have to say sorry it is the truth. I am not sure where to
call him is he up north or down south?

>
>
> >This is where this idea came from I should know
>
> Great. You will also remember when you guys where testing the Viagra
> antenna system on your truck, I told you how to build a remote field
> strength meter. You said that it was the same as Daves (in theory).
>
> Guess I copied his? Although one was never sold to me?

-
No never said you did but if you came to his shop and saw his, then watched
him build his, then built your own and started selling them saying dave got
his idea from Autek I may then say you copied his

>
>
> I am not trying to be a dick, Dennis, I am just tired of the wasted
bandwith
> and the same old shit being dredged up every couple weeks.

==========
I am not trying to be a dick either it just come naturally for me, I am tired of lots of the arguements you and everyone else get into as well about lots of useless info but i don't say anything. I just want to know why is it any different for me to ask what happened to dan, should'nt the consumers know if he is no longer with them. Other than that my post were jumped on by x force 151 and warlock and i said what i felt was needed in my replys Some people dont like the truth. If the rumor I heard was true and we find out in time will I still be a dick?

Funny how I find it hard to believe how ownership went from Big Steve to a mudduck Rich.

Steve? You're doing a fine job. Maybe this copycat dealer here would definitely go out of business, huh?

Laterz...

all drift(ed)
> with temperature.
>
> QRM
------------------------>

I guess I missed the intent of the original, sorry. I wrote in
the vain that 200 hz drift from cold to operating temp was hardly
worth worrying about. I understand it would make the SSB impossible
to understand if not corrected for. I find this small drift
acceptable and never had any problem compensating for it.
Had I needed a tighter tolerance I would have designed a small
heater circuit for the xtal osc.'s in the unit. This would settle
the unit down quicker but it would still have that initial drift at
startup unless you allowed the heaters to run with the unit off.
I might also have added a temperature compensated voltage
regulator for the ref osc.'s, vco and offset control (clarifier).
This would have been more work than having to turn a knob slightly
every now and again.
Since the 2950,2970 and the Turbo are the same radio I would
expect the same conditions from each. In fact, I would expect the
same from any cb or ham radio that is subjected to the rigors of
temp changes.

4626. HTX-10, Major piece of CRAP!!!

Newsgroup: rec.radio.cb
Date: 1999-11-26 00:00:00 UTC
From: Jason Anderson <jason@montero4x4.com>
Message-ID: <383F6E6F.EB049C78@montero4x4.com>
Source record: 13061

This radio was junk. Bought it on Wed., returned it today. Lossy type receive and terrible SSB transmitting. The heat sink from the finals would heat-up after 2 min. of talking. Was not happy. Cranked down to 6 1/2 watts to drive the linear and it was good then but not by itself.

Display was off, tried 3 different freq. counters and all showed the same results(If you are wondering, the main testing unit was a $5000 HP digital-200 mhz O-scope with 1hz accurate freq. count in it).

Final word, DON'T BUY IT!!!. Mine is sitting back in the store waiting for another poor soul.

Get a HR-2510.

Jason

My, my, my... Looks like the DaveMade boys have themselves a little punk now, doesn't it?

I always thought Dennis could fight his own fights, and he always has... Does he pay you for the shit you spew, or do you do it for free?

I prefer to think that you do it for free.... I wouldn't want to lower my opinion of Dennis.

> "Toll Free" Why do you even get involved with these messages

Because I have been around here, put up with the wasted bandwith and have to listen to Dennis bitch about how Danny "stole" the secret DaveMade recipe at least once a month.

It is like a broken record.... It got old nearly 6 months ago.

I like Dennis, always have. That doesn't mean that I have to agree with the way he handles DaveMade / X-Force battles on the public forum of rec.radio.cb.

any way I never
> heard of any product with your name on.

Then you haven't been on the west coast or the south much.

I don't do the competition shit much anymore, but you ask the bigger stations on the west coast (Skipshooter, BigBamBoo and some others), and they will know who I am.

Your insignificant. You know a couple people (and I am giving you the benifit of the doubt here... I really do believe that you know Dennis, and that is about it) that make DaveMade, and that is about it.

Great. I know the same. Now what?

I know your thinks the same about me

No, I think absolutely nothing about you. I feel that you are a pile of crap, who cannot spell, puts a bunch of lies out their and decieves others.

Yep, that about sums it up.

No, wait.... I believe that if Concrete Man told you how to blow your nose, you would listen, and do it.

> but I Am a Dave Made user and was for a very long time.I use nothing but
> Dave Made and that is why I put my two cents in what is your excuse?

Great. Loyalty is nice.

What is my excuse?....

Excuse for what? For my comments?

Because I was one of the oldest people on this newsgroup. At this time, Bill Eitner and Brass Monkey are about the only people out here longer than me. Concrete Man and I have been about the same, I believe. Therefore, I can post what I want, when I want.

So can you, even though half the time you don't know what you are talking about, have no idea of the reality of the world, and are just a stupid kid with a pocketful of change that has found a manufacturer that is more than willing to trick him out.

Yes, what you have been told will work, but not to peak efficiency, and why half step?

>
> Your site links to Dave made and you talk all this shit about them?

Yes, I do link to DaveMade. Who gives a shit.

I talk shit about DaveMade?

No, I don't think so. I talk down to people when I feel that they are opening their mouth and inserting their foot, and more than once I have bagged on Dennis for the way that he is handling the X-Force fiasco.

It is old news, and should be dropped. Everyone knows what is going on and who really cares anymore? But, people shouldn't have to have dirty laundry run across rec.radio.cb a couple times a month.

And FYI, I also did the same to Steve at ExportsRUs over the way he handled the shit about dropping DaveMade. I was the person that got Steve and Dennis together, and then had to watch as people acted like little kids.

I don't hold anything back. I don't care who you are, or what you do in this industry. If I think that you are acting like an asshole, your going to be told that your acting like an asshole. At least nobody here has to figure out which asshole my nose is planted in... Something that was self evident with you!

I don't
> get it every since I posted those emails you sent you totally changed the
> way you talk about concrete.

No, it totally changed the way that I felt about you. Made me realize that you don't have the education that you think you do... At least, you don't have the emotional side of it down.

You remind me of the little tweaker who packs his nose, then goes on a shit rampage.

And true to what I say, about the same time every week, you go hell bent on the newsgroup with more shit.

Gee... Put two and two together and see what you get.

I care less what you, Dennis, Danny or anyone else thinks. If they can't see that someone who speaks their mind, TRUTHFULLY, is someone to listen to, then so be it. However, I don't think that Dennis and I have any irreconcilable differences.

When Dennis has a problem with something I say, he is more than welcome to call, come by, email or whatever me and we can talk about it then. So far, this has yet to happen, which leads me to believe that Dennis is more mature than you, and can have a disagreement with someone and then let it go..

You have been unable to do that, junior.

> I'm sure he doesn't give a flying fuck about me and I don't care as long as
> he gets me my amps his is #1 in my book.

No, your attitude speaks different.

> I don't know why every one complains about delaying

Because it speaks of a couple things..

1. People want to have correspondence with the people they deal with.
2. People want to know that after the sale, the manufacturer will be their to back the product up. When it takes months to get the product, you have to question the after sales support.
3. DaveMade has been plagued with the same problems for quite some time. You would think that the manufacturer would get better distribution channels, better or more builders and would be able to deliver a product in a timely manner.

Yes, everyone can see that their are times when a manufacturer gets behind..... But, they either hire more people, or get their ass in gear and make up for it.

They DON'T let the problem continue to manifest itself until it becomes public knowledge.

how many of these people
> send payment in advance?

Pass?

You know Dave Made isn't dealing apples were
> talking illegal shit here

Yes, and since the 80s, I have been dealing with the people that deal it.

Messenger? Lived about 20 minutes from the person who built and designed it.
Texas Star? LIved about 45 minutes away

Palomar? Lived a bit farther away

Now,

Silver Streak
Blue Face
Magnum
Messenger
Texas Star
Cookie
X-Force

They don't seem to have the same problems with delivering product, and they all ship more than DaveMade does.

What does this tell you?

That they don't have the inner turmoil, they have more people building, they have better distribution, etc., etc., etc. than DaveMade.... Singly or a combination of the above.

and When you get a hundred idiots a day saying
> they want to buy an amp and change there mind you also will start blowing
> off people.

Bullshit.

Only an idiot would think that way.

I have no problem sending money in advance and I have no problem
> getting my amp.

And you also live an hour away.

Gee... Funny how that works, isn't it.

And you are also purchasing a large amplifier, that automatically has more profit built into it.

See the big picture yet, Jr.

>
> Why don't you go start a Texas star thread of your own and keep you.

And keep you what?

I have you frazzled again, I can tell. Your not even finishing your sentences again!

I doubt
> you will get many people to join you but why don't you give it a try.

Been their, done that.

Besides, what purpose would it serve. Texas Star has been around longer than most of the amps on the market today, have a proven design that works

for the targeted audience, and don't seem to have the "dirty laundry" that your boys have.

As a matter of fact, the only time people bitched about not getting a Texas Star was when they where busted!

That seems like a pretty good track record to me.

A. Good delivery.
B. Good product (for daily driver amps).
C. Good customer service (great, if you ask me... Way over and above the call of duty)

Or, to say the same thing that you do... This is a public forum. I can post where I want, when I want, and their is nothing that you can say that will make it any different.

Why shouldn't I be allowed to say what I want, when I want. You say that you can!

>
> Every Dave I get many emails about people making fun of you and your
> stories. It makes me laugh.

Every Dave?

I don't get it.

Did you mean Every Day?

And, sonny boy, I can say the same about you, however, to leave the dirty laundry where it belongs, I don't say anything about it.

The emails don't make me laugh... You do that enough on your own.

> I will be the first to admit that I am nothing in this CB game.

You got that right.

I know I'm
> just a sucker with money but You are not one bit better but you act like you
> are the coolest thing since sliced bread as Denise put it and I find it
> true.

Who is Denise?

Are you making fun of your boy now?

>
> Get a life and stay out of the Dave made conversations if you don't like
> reading them!!!!!!

No. I can post what I want, when I want, where I want.

You said it first. Can you blame someone for following your lead.

If you don't like what I have to say.... Don't read it.

Use the kill file.

Lastly, get off of people jockstrap.

You are a fool, you have a pocketfull of money, and it shows.

Peace I'm back out!!!!

If only that was true.

Why not... Your the one with the big education here.

Or.... Wait... I forgot. It is just nice to talk big, but not be able to
back up what you say.

I assumed that your education must have been in computers, because you
really don't know shit about electronics.

That was proven a couple weeks ago with the crap that you attempted to sell
the newsgroup about volting an amplifier!

>
> This is the same way I dont worry about how amps are built or anything you
> think you know more then me about.

Think?

No, I have proven it.

> When I want somthing I get it. If it cost me money I dont care But I get.
> I have betterthings to do then lean big words and try to impress people on
> news groups.

So do I.

Unfortunately for you... I like to piss you off.

Your easy. Hell, you can't even spell or use correct linguistics.

The Palomar Skipper and Cobra XL models are
Blue Face amps.
http://www.coaxkid.com/amplist.htm
The Palomar Blue Face, Galaxy, and
Cobra-Palomar Skipper models are Blue Face
amps.
I can sell you one as well. E-mail me if
you're interested.

Yes. Cut or unsolder one of the wires going to the
beeper.

> 2. The sensitivity seems good, but the S/N and NL are a bit weak. Any way
> to improve these via mods or in-line noise choppers and such?

There are mods floating around, but it's debateable
whether they're worth the effort. I did some receiver
mods in mine, and I did a meticulous alignment; the
result is an improvement of about 15%. The basic
receiver design is poor; they used bipolar transistors
where they should have used FETs, and the filtering
isn't very good. To see any real improvement would
require a redesign--not simple mods. An old ham
technique that helps a little with that radio is to lower
the RF gain as much as possible (depending on the strength
of the incoming signal) and compensate for the decrease
in receiver audio by increasing the volume control.

> 3. How can the AM mod limiter be disabled while leaving the SSB AMC
> intact? According to the tech who worked on my radio, this is what he did,
> but I just want to know exactly how he did it...

More than likely he simply adjusted VR14 rather than
removing TR32. VR14 controls the AM AMC, and VR16
controls the SSB ALC. In the 2950 there's no gain
in AM modulation by removing TR32. In other words,
adjusting VR14 for maximum AM moduulation is just
as effective and it doesn't effect the SSB ALC.

> 4. Finally, what kind of power output should I be seeing in a peaked
> radio? Currently, I have 2-10 watt deadkey on AM swinging to about 35 max.
> SSB varies from 15-25. I'm wondering if I should tweak this further...

35 peak watts on AM is good for a 2950. I typically
don't see that much, but I'm sure there are differences
in our test set-ups that account for it. If you're
curious, you can put the radio on Channel 19A and
make sure L34 is adjusted for maximum peak (modulated)
output. L34 has the biggest effect. You really don't
need to go any farther, but if you're just overcome

with curiosity you can also peak L19, L48, L47, L46, L43, and VC3, but you probably won't gain much. If you're not going to run an amp, you can crank up the driver bias (VR11). You can also increase the coupling capacitance from the pre-driver to the driver and from the driver to the two final transistors. To do so, increase the value of, or add additional capacitors (up to 330 pF) to, C270 (pre-driver to driver), C261 and C262 (driver to finals).

That about rounds out the typical tune-up mods that are done to 2950s. There are more radical transmitter mods and a host of other mods that can be done to the 2950, but the typical tech either doesn't know about them or won't include them in a simple, low-cost tune-up.

Jason,

It sounds like the master oscillator was not tuned up. Given the other symptoms you noted, I would hazard to guess that this radio missed final inspection altogether. With that in mind, I would've grabbed another one from RS and tried it before throwing in the towel. As for the HR2510, I think you'll find they are out of production now and that the final transistors are no longer manufactured.

This microphone is made by Merry Microphone. I like it personally. Instead of the expensive 7V battery for the unit, you can buy a pack of hearing aid batteries and use them. I forget the battery number off the top of my head, but they are the bigguns that Radio Shack sells. You can probably get them cheaper elsewhere though. When you buy them there should be no tax as they are a health product. Wrap up five of them with a small piece of sticky tape and insert. The battery cover will hold them in place. You can also modify the microphone for considerably higher output. Inside there is a 1k5 resistor that forms the negative feedback for the built-in amplifier. Change this to something with a higher value, say 18k, and you'll find the output comes up in fine style! I had one that I removed both the 22n capacitors and this widened up the output bandwidth a lot. I believe that if you short the 47k resistor together you'll defeat the noise-cancelling function. Unfortunately, somebody broke into my rig and relieved me of mine. :-< I guess I'll just have to get another one.....:->

In short, plenty of tricks with this mic!

MC.

>
hey neighbor, how are ya?
wearing your flack jacket again, huh? or should i say fire proof suit? :)
you are right. there are no more official govt monitoring stations for cw
anymore, (except the FCC OO's and field stations).
maybe they know something that the ham community hasn't caught on to or won't
accept?
the navy has said that it doesn't monitor cw but if it happens to catch a
distress call, they will respond.
to the guy that flash burned you, my opinion is that cw is like riding horses,
once a nesessity, now a recreation. same goes for sail boats, bamboo fishing
poles, bows and arrows and spears, (javelins).
hams always tout the advances that they have helped make in radio technology
for which we all are grateful. i don't understand why they don't let go of the
past to make way for the future?

i saw some old magizines that were written just for commodore computers. in them, there were articles written by bill gates. i doubt he has any commodors in use at home. now there's a success story, his legal troubles not withstanding. he didn't let commodore stand in the way of progress but used it as a stepping stone to get where he is today.
and the ham community wonders why their community borders are shrinking year by year in the hf spectrum. the no code license took off when it was established. if it were me, this would indicate to me that there was a definite shift in the general public's opinion of the nesessity of morse code.
the hams say that if there's a storm or other natural disaster, the code may be needed.
i say in such a disaster, if the antenna's blown down, the code is as worthless as SSB, AM, FM or any other mode
with all of the advances today in radio technology, the code, in my opinion, has become a true dinosaur.
keep it as a pet but don't try to ride it on the interstate.

> As far as why I am not on a REAL computer

i don't know what you use your computer for but for me, if my old packard bell 40 mhz, 8 meg ram, junk video card, 1/2 gig hard drive didn't take a dump, i wouldn't be on this newer, used one now. the best part about it was the 56 k fax modem that came with it which is like putting a truck transmission in a volkswaggon.
my friend that takes care of this thing says that i needed windows 98 and norton utilities.
with all of the new fangled stuff that i have to go through to get this thing to turn on and off, i'd almost format the hard drive and go back to windows 3.1 if i could but the bios won't support it.
compaired to the glider that i had, this thing is like a jet.
i don't do anything fancy with this thing, just cruse the net.
i've not seen any problems with any of your posts so if your happy with your net access then i say keep it regardless what the other guy said.
it seems that the RF police mentality is bleeding over into peoples computer practices.
some people like old tube type radios and still use them and the "state of the art" crowd laughs at them.
until, ofcourse, the first millisecond that they key up into a high SWR. by then the damage may already be done where a tube final may have been more forgiving.
have a good day.
jeff

HR 2346 will force the FCC to train the locals to recognize radios.
However, if the locals ever catch on to the "fine" business since then
local courts will be permitted to have jurisdiction, then it could mean
a major change in the radio hobbies.

Just back from a visit to Radio Shack, No HTX-10 in stock, not a "Ham"
store since they don't sell that many amateur radios. BUT there was an
irate customer in there complaining about interference to his TV and
telephone from a high powered station (I am the only ham in the area) so
I guess Billy Tauzin will get another letter from a dis-satisfied voter.

You have to understand that there are a lot of jerks that work for radio shack (or are in love with RS for some reason) that can't relate to an Item being sold by Tandy as being bad in ANY way. These dudes cum in their pants every time Radio shack announces a new "new" house-labled radio or VCR that is either always already being made with another name on it, or is a no-big deal overpriced piece of crap. (the HTX-10 is the same EXACT radio as the Magnum 257 & superstar 4900+ except for the un-modifiable chip in the tandy, I've seen all 3 opened). The stupid part-time salesman read all the company generated propaganda that comes to the store on official Tandy letterhead and repeat the crap back out to US. When "consumer reports" rates some RS item good, they tell you they know it's the best, when they rate it bad, as in the recent consumers that put even "drug store brand" batteries ahead of RS, they tell you their tests must have been "flawed". The HTX-10 is a good price at $140-150, but I'd rather pay $179 & get the model that will do 25-30Mhz. Better than paying $80-150 more for a 2950/Lincoln with similar features & power. "give me your name & address NOW, then swith your phone over TO sprint, then give me another $40 for a "service plan" & I'll take your money & put nothing else in the bag, SUCKER!!"

4649. Re: Antenna/message board question?????

Hello R Smith9695: The 4 element horizonal should be pretty easy to put together, but can be a real bear to get working, and tuned in. Contact Allen Telecom at:

http://www.allentele.com/antenna/products/.html

They can send you a copy of the Moonraker 4 beam assembly plans, this will be a good start. Also look at the MaCo Antenna web site at:

http://www.majestic-comm.com/maco/support/index.htm

Maybe you can make your 4 element like the MaCo 4 element beam antenna. And you can probably buy some of the Gama match parts to get it all tuned in, if you don't have the Moonraker 4 parts already. Ley us know how you make out!

Jay in the Mojave

4651. Re: ???Cobra 139 SSB Freq. Adjustment

Newsgroup: rec.radio.cb
Date: 1999-11-27 00:00:00 UTC
From: pllo2a@aol.com
Message-ID: <19991127160900.08253.00001402@ng-cg1.aol.com>
Source record: 13019

the "tuning thingy" refered to in the other response is a trim cap.
this will only make a small difference in the freq adjustment.
if you're off by more than a few hundred hz, you may have a bad crystal. which one will have to be determined one ocillator at a time with a freq counter or ocilloscope.
if you are off by multiple, whole channels like 1, 2, 4, 8, 10, 16 channels above or below the intended frequency, you may have a loose solder joint on one of the program lines between the channel selector and the PLL chip, a bad channel switch or a blown program gate in the PLL itself. i was tinkering with a rad shack radio that had a TC-9106 chip years ago. i crossed the wrong leads and fried the chip.
my watt meter showed good output but i couldn't find it anywhere on my pres 2510,
(no freq counter at the time). i took it to a friends house and put it on his and it was putting out 25.4173 mhz on all 40 channels.
a 25 mile drive + $14.00 mistake.
good luck.
jeff

>
are you trying to blow this guy's radio up?
you NEVER mount a firestick to any metal part of a vehicle without insulation.
if your's were the case, where would he connect the coax shield? to the same
bolt?
the only time you don't need insulator washers is if the bumper is plastic.
then you have to run a ground strap from the antenna mount GROUND to the frame
of the vehicle.
have a good day.
jeff

code a Dinoaur, its more like a fool trying to drive Model A on I-75 at
5 pm but then you live in the state of fossel (florida). Time for CODE
TO GO, hope to see latest revision from FCC on Amateur Code requirment.
I petitioned for a 5 wpm MAX to satisfy the International Requirement
but the FOSSEL Division wants 20 wpm kept as the standard.

CW hahaha.. i will admitt this i am a ham.. i have passed (just passed) my 13wpm test.. I hate code it sucks and i wont ever use it i dont even own a paddle. I just went and did it because i wanted access to the general lisc and better world wide activity instead of waiting for 10 meters to open.. thats it.. and as a side note i grew my radio ties on 11 meters and think its cool. I dont have a prob with cb.. i talk to my dad sometimes also on it.

explorer wrote that you should mount a firestick to your bumper with a bolt
with direct metal contact between the antenna and bumper.
THIS IS WRONG!!!
NEVER mount a firestick or similar antenna to a metal bumper WITHOUT the
insulating washers supplied with a mount made for such antennas. the directions
should come with the mount.
if you install it his way, you'll burn out your final transistor and void your
warantee.
the stud mounts for these antennas actually are 2 separate connections.
there are 2 different styles to choose from.
there is 1 that you have a threaded sleve that you bolt to the bumper or other
part of the truck and screw the antenna into the other end of the sleve. when
installing the bolt, be sure to connect the center conductor of your coax,
preferably with a solder lug, on the bolt in direct contact with the bolt head.
THIS is your antenna connection. for the coax shield braid, this needs to be
grounded at a conveinent point near the antenna. THIS is the ground connection.
the connection to the bumper, frame, or body must be clean. if you groung to
the bumper, be sure ALL of the joints between the bumper and frame are clean.
if they aren't, at best, you'll have a degraded signal with a distorted
radiation patern or, at worst, you could cause damage to your final transistor.
there should be 2 nylon shoulder washers supplied with this mount. you drill a
hole in the truck where you want to mount the antenna. the hole should be
slightly larger than the bolt to allow the rasied portion of the nylon washer
to set into the hole. the washer near the head of the bolt should be "face up"
and the washer that goes on top of the bumper should be "face down". the raised
shoulders of these washers should both be set inside the hole so the bolt
doesn't come in contact with the bumper. then, screw the threaded sleve onto
the bolt. don't tighten it down so much as to crush the insulators but make it
snug enough so as not to work loose.
then screw the stud at the bottom of the antenna into the top of the threaded
sleve.
it is generally easier if you run your coax through the truck before connecting
it to the antenna as the smaller end of the wire is easier to push through any
holes than the antenna plug would be.

the 2nd type of mount is nearly the same.
it has a stud that screws into the same type threaded sleve but the other end
has a socket like the antenna socket on the back of your radio.
this one mounts the same way EXCEPT it only uses 1 nylon washer.
in this mount, the ground connection is made for you when you mount it into the
bumper.
the flange at the base of the stud IS the ground connection in and of itself
and MUST come in contact with the underside of the bumper. before installing
this kind of mount, you should go over the UNDERSIDE of the bumper with sand

paper around the hole to get rid of any paint, dirt or rust for a good ground.
if you look at the base of the stud where it meets the flange, you'll see a nylon or teflon insulator that separates the stud from the flange.
BE CAREFUL as you CAN pull the stud right out of the flange by overtightening it.
use the same percautions as the bolt mount above.
be sure to use the shoulder washer "face down" onTOP of the bumper as listed above as this will insulate the stud from the bumper. it is wise to use an ohm meter to check your work. test for continuity between the bumper and the FLANGE of the mount. there should be zero ohms or a full scale reading on your meter. also check between the chrome base of the antenna or sleve and the bumper. it should read infinity or no meter movement at all. if the opposite is true in either case, recheck your work and correct any problems BEFORE you use the radio or damage may occur.
after installation, you get out your coax that has 2 PL-259 antenna plugs and string it through the truck. screw one end into the bottom of the antenna mount and the other end into the back of the radio. which ever mount you choose, be sure ALL coax connections are tight and clean. you don't have to break out the vise-grips but a real finger tightening will be worth the effort.
if you choose a firestick style antenna, it is a good idea to get one that is long enough to extend above the cab of the truck as much as practical.
if you look closely at this type of antenna, you'll see a coil of wire under the plastic outer coating. it can be seen better on the antennas that have a clear coat but the shape of the coil can still be seen under the colored ones.
these are top loaded antennas where most of your signal comes out of the top. you want this part of the antenna above the cab so as not to distort your signal. there are many brands of this style antenna out there but not all antennas are created equal. personally, i like, and have used, the firestick brand. it matches and performs well. if you choose to get into the out-bands, for the price, the 7 footer is fairly broadbanded. with cb antennas, generally, the longer, the better. if you only talk on a small group of channels that are clumped together and don't have the need for great range, you can get away with a 3 footer. for best performance, go long.
a heavy duty spring at the bottom of the antenna would be a good investment too, especally if you like to go into the woods, to avoid damage to the antenna or the 2nd style of mount should you choose that one.
there is a 3rd type of mount called a ball mount. this one, by far, is the sturdiest one of the 3. the down side to this mount is the fact that you have to drill 3) 1/4 inch holes and 1) 1 inch hole to install it. all in an area that is about 3 inches in diameter.
it knocks the hell out of the re-sale value of the truck. much more than a 1/2 hole for a stud mount.

after you mount ANY antenna, another good investment would be an SWR meter. or, at least, borrow one from a friend.
in simple terms, it will tell you the general condition of your antenna system. this information is especally important if you go 4 wheeling in the woods where the antenna is going to get smacked around a lot.
you connect it between the antenna coax and the radio. it can be left in the line for continous monitoring of your antenna's condition and, if you get a

small enough meter, you can mount it within easy viewing of your drivers seat. you don't have to watch it, just glance at it when you key the mic. should something come loose, it will tell you, at a glance, when you key the mic. this way, you can avoid damage to your radio.
i hope this helps and happy 4 X 4'ing.
jeff

4661. Splash problem with HR-2510

Newsgroup: rec.radio.cb
Date: 1999-11-27 00:00:00 UTC
From: "CLEAR, Inc." <simirocks@earthlink.net>
Message-ID: <38405032.72C3@earthlink.net>
Source record: 13029

I need help!!! I have a guy about 1 block away from my house who has a CB and is running about 500 watts on AM. My poor 2510 can hear this prick from 26.000 - 28.000 when he is on the air...Is there anything I can due to cut down the splash? Will it kill my radio's sensitivity for shooting skip? (That is pretty much ALL I do on the radio) Someone mentioned the chipswitch? Would this help?

I'm ready to get sell this rig, if I can find a better radio that isn't such a splashbox...Any suggestions?

4663. Help? Schematic or Manual for Hytek Antenna Control?

Newsgroup: rec.radio.cb
Date: 1999-11-27 00:00:00 UTC
From: DavidC <eDoc@netzero.net>
Message-ID: <s40oi91ba4r54@freenews.remarq.com>
Source record: 13031
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.cb

I have been given a Hytek Antenna Control box. No rotor,
no manual, no schematic. Anyone have data to share?

There are markings on the label "36V DC R".

The label reads:
TDF Corporation Neosho, MO Serial # 28-633

I'd like to discover if it may be adapted to other rotors or used
for other control purposes.

- Thanks! & 73, DavidC K1YP

>talk.
>
Hmmm. I've never heard of "lossy receive" either. Maybe its a local slang
phrase they toss around in their shop/lab.

"....equipment that cost more than your car...."

Yeah. Right! Try multiplying your $5K by five or six. Or were you speaking of
your personal exprience, Jason? Not all CBers drive junkers!**

My disappointment with the HTX-10: No CW provision.

QRM

**Note about antenna mounts on year 2000 GM autos. The trunk cavity slopes in,
so the standard No Holes Visibile antenna mount won't work unless its flexible
enough to be bent. We had to switch to a trunk lip mount for the Wilson when
the new car came in.

Since CB radio is now regulated by local authorities, call the local police department if you have evidence that he is "running about 500 watts on AM" Turn yourself in while your're at it, since you are breaking the law using the 2510 too.

Doin' fine jeff, ty. I really do not understand some people. Like I made the rule or something. Hell, I didn't say whether I enjoyed, or even used cw, all I said was it was outdated and they aren't monitoring any more and the dude slammed me! Oh well. Yea, we definitely reside in the land of the newly-wed and walking dead. Hope everyone had a great holiday and caught some of the international stuff that was running all day. What a day! With winter comes the start of my favorite season: DX season. I have heard some cw recently on 10 meters, but after listening for awhile it was apparent no long distance stuff was rolling, just local banter. As I stated previously, I really don't have a strong opinion on it either way, but most of the pro-cw folks' mindset seem to be a "I had to do it and so should you" kinda thing with no real merit. Most of the freebanders I know really don't care either. If they want their cw, fine. If not, that's fine, too. Hell, let 'em fight it out amongst themselves. I'd rather listen to an RF cop lecture me about freebanding than argue this code thing. At least the RF cop's lecture has a BIT of merit(albeit ever so tiny).

instead of offering some constructive help you flame the guy for receive problems. (since when is using a 2510 to receive illegal? take away my icom 751 if you dare.) and where are you located in the u.s. where there is local authority over cb operations? to the original poster, the chipswitch will not help in reducing the splatter you hear. the chipswitch mod is for expanded freq availability and some other items. as far as the 2510 being a splatter box, its actually a fairly narrow banded rig on receive. the problem is your 'neighbor' and his dirty rig and the wattage he is xmitting. there are some cb rambo's out there who have advocated trashing an obnoxious operators coax or even his shack but that does'nt really work try talking to the guy and if he is still a prick then contact the fcc (good luck with that one). dont give up on the 2510's. good rigs that are hard to come by. 73, jim.

Subject: Blondes are beautiful

A man was in his front yard mowing grass when his attractive
blond female neighbor came out of the house and went straight
to the mailbox. She opened it, then slammed it shut and stormed
back in the house.

A little later she came out of her house again, went to the mailbox
and again opened it and slammed it shut. Angrily, back into the
house she went.

As the man was getting ready to edge the lawn, here she came again,
marched to the mailbox, opened it and then slammed it closed harder
than ever.

Puzzled by her actions the man asked her, "Is something wrong?"

To which she replied, "There certainly is!. My stupid computer
keeps saying, "YOU'VE GOT MAIL"."

Greetings!

And why they're called pills, is due to the long hours those back room
techs put in each day...

Sometimes they can be mistaken for BUFFERIN...;->

While Dancing with the Mouse on Fri, 26 Nov 1999 17:52:11 GMT, the
Modem interrupted with an MNI from ""prozac 625"
<prozac625@bayshorenetwork.com>", and the MotherBoard buffered this to
Video RAM:

:+> The term Pill is used for the transistors used in CB amps. Such as the 2290
:+> & the 2879 transistors by Toshiba. And also some MRF and other types. They
:+> look like a big white pills.
:+> A 16 pill = 16 2879's, A 5 pill = 1 2290 & 4 2879's

BUFFERIN=Releives Operator Headaches caused by small BUFFERS...

Regards!

The term "pill" is a silly CBer word for RF Power Transistor. Nowhere else is the term used. I don't know where it originated, but I don't like.....I don't like it at all.

: >which skip has worked for me.

: Huh, I always thought skip was the radio wave bouncing through the upper Ionisphere, and then
: finding a less dense pocket of O3, and the signal falls back to earth. But, I guess I was wrong.

Yes, the signal does bounce of one or another of the ionization layers in
the atmosphere. But the bit about a "less dense pocket of O3) is bogus.

It is unlikely that there are multiple bounces in the ionosphere before
returning to the Earth, but it "could" happen. The usual path for any
multiple bounce skip is: transmitter to ionosphere to Earth to ionosphere
to Earth ... to receiver.

It isn't necessary. I trust you will agree that the transmitter in not seeing the designed 50 ohm impedance at the input to the coax. In other words, it is not operating into the designed load.

But the input power to the finals is the same as with a perfect match. The input cannot see the mismatch on the output. The result is that, due to operating into a mismatched load, the finals operate at lower than designed efficiency. This means that there is less power out of the finals - with more of the input power being converted to heat in the transistors/tubes.

From: CodysPC@Iserve.Net
Message-ID: <383f6dbd.184811438@news.iserv.net>
Source record: 13092

Greetings!

What was being described, and what is pertinent to the radios own are two different things.

Input *to* the finals.
Output *to* the antenna.

Unfortunately the impedance present on the network *to* the finals is different due to the mismatched load. This we can agree on.

To have "Reflections" claim "Automatic" deserves some clarity.

Automatic as in the Unbalanced Output of the network, and the "Impedance the radio sees from the load". Which one is which?

One deals with the network.

The other deals with what goes out the radio, and into the load.

To simply state "Automatic" is not really answering questions regarding the load, and how the radio reduces power.

The output of the radio and the input to the load is simple, it's "automatic". Impedances are not equal.

But to say the "radio reduces power automatically" - thats my axe to grind.

Remeber what he says about Z2 and the Dummy load. You now have two types of matching impedance - one pure resistive, the other reactive.

It was phrased as "You can lose power".

So, Why in H*ll write the d*mn book in the first place?

What has it accomplished?

1. Only that a Dummy load shows resistive.

2. You can use coax to conjugate an antenna at a different R+/-jX using the opposite +/-jX the coax can present for conjugate match for SWR control. Can't solve for R, which was said before, but at least you can get the SWR down.

3. That if your Source impedance and load impedance aren't correct you lose power "Automatically" as far as the radio is concerned.

Because of the radios Network sensing a different impedance, than that of the antenna system, reflected power is not considered a loss.

Very good! Now, what about that source impedance versus antenna system impedance? Brings us right back to number one.

Only thing? Reflected power is not considered a loss, at least not yet. But "the radio reduces power automatically".

I wonder why?

Which brings us right back to number 1.

Basic common sense.

And people flame the h*ll out of others for "trimming" coax.

H*ll, flame them for not running the right antenna to do the job!

Or, for grins and giggles, send them a copy of Reflections!

[Sorry folks, I have my copy...;-]

It's not going to make the problem go away. People are going to do what they want.

This is why it's more important to say "You have to settle for what you get." Than to inflame a riot over "Don't cut coax!"

It's bad enough when people don't understand the LOCATION is one of the many keys to solving the inflammable answering of "trim coax".

Maxwell, for all his effort, is saying IMI - "Arriving to a conjugate match to arrive to the output impedance of the radio, the radio then can load it's full power into this type of matching system. The antenna attempts to radiate this power, and some currents on the outer shield do occur but multiple reflection and forward power, their *incident* power remains the same as the radios output power into this type of load. As if this mis-match never occurred."

Nobody ever spoke up for the Manufacturer.

[Don't tell me they're the ones that started all of this!]

Did anyone read the last chapter? He raises all those questions and concerns again - and summarizes it all as to "Transmitter can be damaged if your radio and antenna impedances are different".

Bandwidth of the Tank coil circuit for the final is what determines the radios ability to survive a mis-match. It [coil] and final have to exceed the impedance changes the load will present - this presents the *actual* SWR Mis-match the radio can safely handle.

Sorry, folks, the Dummy load has it's place, but the real world is a completely different universe.

So what happens to all this reflected power? Well, you increase the bandwidth the *incident* power creates. Nothing is lost, only converted, or conserved - with marginal losses in heat and resistance.

This is a pure test of the conjugate match - when the bandwidth of the
matching system, can exceed, and provide control of, SWR before the
increased bandwidth caused by "incident" power changes the networks
impedance response to the finals tank coil circuit and ruins the
finals.

Brilliant!

Can we all get on with our lives now?

4709. Re: freq off on RCI 2950

Newsgroup: rec.radio.cb
Date: 1999-11-27 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <383f6ea8.185047328@news.iserv.net>
Source record: 13094

Greetings!

There is a TX freq adjust in those things.

When broadbanded, the RCI shouldn't exhibit any real change in
frequency.

If it is, re-check the work. Sounds like a loading [voltage or current
leak into the RX/TX bias for PLL reference] problem.

Check voltage!

When the radio keys up, the voltage should not drop. They're regulated
to within 1/100th of a volt - less than 5 Hz if any change is noted.

If you're dropping 200Hz, I'm wondering if this is consistent. e.g -
Both RX and TX are off 200Hz or just one portion?

To check that, requires you to look at the two reference IF's. That is
a realm of the RCI I haven't been into yet.

You just have to locate the one that drops [let's see 10.240 and
16.XXX for Uniden style - I'd look at both, especially Audio IF - ones
I've come across that "bail out", are usually due to loading of
loud/heavy audio into the Xtal filter/mixer and can cause voltage to
drop out. Disclaimer: These are from Uniden notes, not RCI.]

You may also have a problem with "tracking" the external freq counter
does to the signal. Trying to travk audio from SSB radio full blast,
you don't get a very steady reading - an external radio "Audio Check"
with a remote base radio and an honest operator would work better.

Check Carrier Balance, no carrier power should be emitted. The carrier
can also cause the shift you see in the freq counter.

While Dancing with the Mouse on 25 Nov 1999 09:37:13 GMT, the Modem
interrupted with an MNI from "rjchen@leland.Stanford.EDU (Robert
Joshua Chen)", and the MotherBoard buffered this to Video RAM:

:+> Just got an RCI 2950 modded for 26-32. I noticed that its freq display is
:+> off by 200 Hz. The radio transmits 200 Hz below what it reads on the
:+> display, according to an external freq counter. I'm wondering if this is
:+> normal for this radio or is it indicative of a bigger problem (alignment,
:+> etc) that may need looking into?

>This is because your radio is drawing current and the resistance of your
>power
>leads is actually dropping the voltage a little when you transmit.

this actually dropping the voltage quite a bit as the radio companies don't spend anymore on things like wire than they have to.
theoretically speaking, assuming the radio actually swings 50 watts, it is drawing 12 times more power on the so-called 50 watt peaks than the supplied power wire was originally meant to supply for the original 4 watts out. if the power level drops below the internal voltage regulators lower threshold, he could actually be frequency modulating his signal if the voltages vary by a large enough ratio at the PLL as to affect the loop filter, lock detector or the VCO.
heavier wire from the board out would be in order if this were the case.

>> Also my SWR is a little higher now, is that also because of the new finals.
>>
>
>The VSWR should not be affected by the output power. It is a relative
>reading.

>Basically, your
>mechanic has bastardized the radio such that it will over-modulate like
>crazy.

>much of your
>signal's energy is wasted in harmonics that won't be heard by anyone.

you've answered your own question here.
the mechanic has probably fiddled with TVI filtering or has over run it with the extra power levels installed.
if he's transmitting harmonics, this WILL show up in an SWR meter as they're very broadbanded and are not frequency selective.
his antenna may be 1.1:1 at 27.XXX mhz but it will be substantally higher as he starts transmitting 2nd and 3rd harmonics past it's filtering, that the antenna is not matched to.

>It could be that the extra power is making your VSWR meter read more
>accurately
>as it is working with higher voltages now.

>
>> The person who installed the finals said I had 7.5watts swinging to 50,

he didn't say whether he was watching his SWR meter during modulation or not.
if this is the case, when he sets his SWR meter in the cal. mode at 7.5 watts, when that 50 watt swing hits it in the ref. mode, his caliberation just went

out the window and the needle will swing higher for sure. it will look more like a modulation meter because it is trying to read a peak power level almost 7 times higher than it was originally set for.
to get an accurate reading under these conditions, assuming he's not throwing harmonics, he would have to inject a tone into the microphone that would give him maximum swing while setting his calibration. then he could see what his actual SWR would be under max. power conditions.
jeff

>Was wondering if it was illegal or not to inform people of radar traps and
>what not..

i don't know for sure but my guess is that it would vary from state to state.
it may be viewed as interfering with law enforcement but i would ask AAA.
they would be able to tell you.
they know all of the speed traps and tricks.

>Also I plan on getting an amp for my cb.
>Was wondering if say I was to get pulled over and the BEAR seen the amp if I
>would get a ticket or something for it?

not yet but there's a bill in congress now that might make it possible.
call your congressman and tell him to vote NO as it's the FCC's job and not
some un-trained persons job.
larger metropolitan areas may have hams or trained personell on the force who
can tell the difference between an illegal 11 meter amp and a legal 2 meter amp
but in smaller localities, they may not have the budget to properly train
someone and the law won't be properly applied in every case.
good luck.
jeff

Not Everybody runs that low ah power for a driver, get a hold of yourself man.

Gee Whiz, if you complain about such insignificant things, I wonder what the Big Ten-4 things do to ya Joe? And again you offer no real help. I use to like to read your posts, RH2, but you whine way to much. Sure sounds like a liberal Democrat.

Hello Clear Inc.: The channel guard will help, but the all round best thing is a beam antenna that you can turn the beams side null to the other stations direction, reducing his signal or interference, by a whopping 30 to 40 dB! The bigger the beam the more side null you will have, if the beam is installed away from near by objects.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station. Miss Dinah (says:) "Winters ah coming U Desert Rats".... the fillin station has the good heavy duty Tarps to cover your tractor. I bought two, one fer the still, and one fer the tractor.

There is the strong possibility that you have a "view" applied
to your newsreader. If so and the newsreader is set to "hide read
messages" then once you read the message it will not show up again
on your screen. The message is still on the NG but you're not gonna'
see it. You would need to go into your newsreader and tell it to
"show all messages".

Spike wrote:
>
> The Power/Noise Cancelling Mic, 21-1177. Is this mic any good.

No. A noise-cancelling, power mic is a contradiction
in terms. Either you want a power (amplified) mic or
a noise-cancelling mic. Beyond that they simply sound
bad. In an attempt to cancel noise, the designer
decided to roll off the mid-high end frequencies--which
makes you sound bassy with no punch. That's exactly
the opposite of what you want.

> Looking
> maybe to get for my Cobra 29WXNWST.

Good noise-cancelling mics include the Turner RK56,
and the Astatic 636L. If you just have to have an
amplifier in the mic (you don't need it if the radio
is tuned up--29s have plenty of internal mic audio
amplification), the Astatic Road Devil is a decent
choice as long as you don't get carried away with
the volume control and negate its ability to cancel
noise.

> Thank you!

You're welcome... I hope this helps.

There are now four different radios using the same (or similar cases):

1) Radio Shack TRC-485 - Discontinued in 1999
11 meter SSB (not set up for out of band operation)
Yellow colored display
Through hole main PCB

2) Eagle SideWinder 400 from Copper - Still available
10 meter SSB (convertible)
Yellow colored display
Surface mount main PCB
Better built than the TRC-485

3) Radio Shack HTX-10
10 meter SSB (convertible status unknown)
White colored display
(I have not personally had one open)

4) JCRE 485
10 meter SSB (claimed to be convertible)
White colored display (identical to HTX-10)
(I have never seen one in person)

bill wrote in message <01bf36ca$a26401e0$6c84c03f@bill_pc>...

4736. Antenna/message board question?????

Newsgroup: rec.radio.cb
Date: 1999-11-27 00:00:00 UTC
From: rsmith9695@aol.com
Message-ID: <19991127095821.19240.00001007@ng-da1.aol.com>
Source record: 13169

Help Please?

I have posted twice now a message, for help on an antenna,,, but it doesn't seem to stay on the board? So here I go again....

I have enough parts from an old Moonraker 4 to assemble a 4 element horizontal. I would like to use a straight horizontal reflector element, 18 1/2 ft. maybe? I need ideas on element lengths and spacing. I have no original information on the Moonraker assembly measurements. The driven element now measures 17 1/2 ft. I have no idea if this is the correct measurement or not. I don't know what the director measurements are supposed to be or what the spacing is supposed to be either. Also, I need suggestions on the tuning process.

Any help and suggestions on the antenna project and problems with the message board would be greatly appreciated.

Thanks for any replys

These were facts that I stated, NOT OPINIONS. Read alittle before you post. The heat problem, freq offset, noisy receive and transmit, yea, sure, those were just opinions. I guess you buy all this expensive equipment just to have an opinion.

DUH

Funny how my freq counter shows 28.507 but the HTX shows 28.500. But I guess that's an opinions too. Not a fact. Funny how my HR-2510 show 28.500 or 501.... Maybe the 2510 is a piece of crap!!!!! and not the HTX.

What's YOUR opinion Chris???

> jeff
jeff,
also look at speedtrap.com, they have lots of little tidbits. I don't
know of any state having such a law banning "bear reports" but then the
AAA might be a useful source.

As far as AMPS bringing attention, I would recomend keeping such stuff
out of sight and thus out of mind. Alabama and Louisiana State Police
have been clued in as to what an AMP is, so I would not be opening up my
dave made right next to a patrol car. I was stopped in Alabama after
the BEAR saw all my antennas and inquired. I just showed him a copy of
my ham ticket and he clued me in on what was happening. It seemed that
someone was running enough power to cause electronic modules on cars to
mess up and it had caused a wreck. When I asked about the "propriety"
of a State LEO enforcing FCC Law, I got a quick lesson-it seems that a
LEO is a LEO, so if he observes Federal Law being "breached" then he may
act (Bank robbing is Federal Crime, but Barney Fife would like to catch
him anyway;-)(I should have remembered this from my LEO days on
Sheriff's office) (I took an oath to defend and protect the United
States, The State of Louisiana and the Parish of Lafourche) so it boils
down to what mr bear wants to do? To continue the story, they call the
FCC via their dispatcher to see what is to be done. They usually

confiscate the AMP and turn it over to the FCC (who either destroys it or recycles it?) Now for the unsaid part, I don't think I would want to be a smart aleck on the side of I59/20 with the LEO since Alabama jails are not known for thier hospitality, so a word of caution. Keep it outasight-outtamind.

How do you know davemade doesnt try hard, build a quality product, and stand
behind it. Have you ever dealt with them personally? Have you ever bought
anything from them. ? Are you going on second hand info? Ask some of the
guys in here who have bought from them How they rate? Not someone who hasnt
had any dealings with them.

If that makes me an X-Force cheerleader, then so be it. If that's
> what I am, I think I'm a lot better team representative than your
"prozac".

What makes you any better than him? He loves his davemade amps, and is
willing to brag about them even if he had to wait. His only affilitation
with them is that he likes there product. I doesnt make him a bad guy.

The radio line, TRC-485, Sidewinder 400, Prostar 400, Blackhawk 400, etc. has always hot. I've had a TRC-485 for 4 years now and have NEVER had a problem with it!!! I also have 2 Eagle Sidewinder 400 with NO PROBLEMS!!!
The frequency readout is only a reference.
And lastly, $140 for an entry level HTX-10 10 meter rig with a lot of features is a good price!!! Your actually the first person to slander the HTX-10. By the way, If you didn't like the radio you should have taken it back BEFORE you screwed around inside. Now some good decent REAL AMATEUR radio operator, you know, one with a LICENSE is going to get the one you FUCKED with and SCREWED up for Christmas, WAY TO GO ASSHOLE!!!!!

"Thats only my opinion, I could be wrong"

4756. Re:GET A LIFE CHRIS (Damn, I mean Carl) K5DC

Newsgroup: rec.radio.cb
Date: 1999-11-27 00:00:00 UTC
From: Jason Anderson <jason@montero4x4.com>
Message-ID: <384021DD.170E3073@montero4x4.com>
Source record: 13189

First of all chris, TAKE A CHILL PILL. Why are you so obnoxious and rude. Apparently, you know very little about HAM technology. Let's try this...

1. USE YOUR REAL CALL SIGN. K5DC??? I don't think so. If it's true, then you are.

CARL D. CANNON
306 N AVE D
SPRINGTOWN TX 76082,USA

OK CHRIS???

2. These radios that you mention are not even the same electronics inside. They may be similar, but not the same manufacture. The Sidewinder400 is a DIFFERENT radio. Anybody else who wants to challenge me on this?? I suggest you take a look at the CPU #'s and then go look up the table (HEX CODES) for each one and THEN look at the differences. DUH

3. $140 is a good price. WHY DO YOU THINK I BOUGHT ONE???, but the features are just ok. They are plain jane and are on just about every 10 meter rig out there. And also, I'm not the only one to slander the HTX-10, try hanging out on the ham newsgroups and IRC groups. You go on there talking about your hip HTX-10 and you'll be the laughing stock of the group.

4. Besides cranking down the power and then raising it back up(again, I have test equipment that's worth more then your car.) the unit was putting out the SAME amount of power as when I got it. What do you use Chris (or I mean Carl) an analog meter that swings and peaks for measuring?? When was the last time you had it calibrated on 10 meters????

5. The REAL AMATEUR who gets this unit will only be able to talk to his other friends out there for about 2 min. before the finals go into thermal shut-down and then wait for them to cool so he can talk for another 2 min. BUT wait, that's after all his friends tell him that he's OFF FREQ by allot and has to use a freq counter just to tune in the right one SINCE THE RADIO IS GIVING HIM FALSE FREQ READOUTS CAUSE IT'S A MAJOR PIECE OR CRAP.

6. "WAY TO GO ASSHOLE"??? Nice one Chris (damn, I mean Carl), just shows the wonderful person you've grown up to be. But that's only my opinion.

7. Web-TV????? "Chris thinks that WebTV and Radio Shack are da' bomb baby!" YOU MEAN CARL!!!! RIGHT K5DC???

Chris wrote:

Message-ID: <792-38401587-187@storefull-214.iap.bryant.webtv.net>
Source record: 13190

I just got a new Palomar 225 blue face. I turned down the AM dead key to
2 watts. The radio still peaks at 15 watts AM and SSB peaks are at 25.
Will the high PEP damage the amp after awhile? Thanks.

Why did you not simply ask for an exchange radio? Lemons happen sometime. Or did it become, by chance, a lemon after you tried - and failed - to modify it for CB use. What is lossy type receive? With funky terminolgy like that, are you even qualified to use your "$5000 HP digital-200 mhz O-scope with 1 hz accurate freq. count in it" test gear? Of course the heatsink got hot. That is what they are designed to do.

Jason Anderson <jason@montero4x4.com> wrote in message news:383F6E6F.EB049C78@montero4x4.com...

Was not looking to start a big thing with my post
asking for Opinions about Davemade Products.
In fact, I have used many amps from production line amps to X-Force, No Name, and Davemade. My X-Force and No Name are gone and I will only use Davemade Amps..Dennis has always been fair with me and the amps that I have purchased were as stated on the web page..Never had to wait a long time to receive the product, and I have been the recipient of many compliments using the Davemade line. If I offended anyone by my post, I am sorry..It was not intended for that purpose.The Kaptain

This is the reason why you have legislation like the Ehlers Bill being proposed, not because of any anti-cb/pro-ham vendetta.

>guess that's an opinions too. Not a fact. Funny how my HR-2510 show
>28.500 or 501.... Maybe the 2510 is a piece of crap!!!!! and not the
>HTX.

according to the manual that came with my 2510, the display is only that. a frequency indicator, not a counter. it also suggests a 10 minute warm up period to stablize the vfo.
the specs also give a freq tolerance of + or - 300 hz which won't show on the 2510 display either.
there is a non-chipswitch mod that i saw for the 2510 in a ham magizine about 15 years ago that connects a different transmit mixer xtal through a small relay that is activated by the key line.
it was for fm repeater offsets.
the article warned that the display would not reflect the new offset frequency.
knowing where rad shack radios are built, (the far east), it wouldn't be too far out of the question that you may have got a defective one.
5 years ago, i bought a "brand new", (back plate said mfg in 1978), midland 40 ch cb at a yard sale.
it was in such good shape that if they still made the same style of radio today, you could have put it on the shelf and sold it for new.
i spoke to the owner at the yard sale and asked what if anything was wrong with it as i like to buy damaged radios to fix up.
he wanted $8.00 for it and complained that from day one there was too much noise in the receiver.
i took my prize home and checked it out and sure enough, he was right. it would receive 5 channels on either side of the channel that it was set on for a total of 11 channels at one time. it received them as though the radio was tuned to each one.
upon further inspection, i found that, from the factory, 2 of the 3 pins on the 455 khz ceramic filter were bent and soldered into 1 hole efectivly removing the filter from the circuit. after removing and reinstalling the filter, the radio worked perfectly. it now has 114 total channels with no new switches. (PLL02A board). it is the showpiece of my collection by virtue of it's condition. 53 radios in all.
i can't say that you're wrong about your radio but i have heard a lot of good about the HTX-10 for the price.
like i said, maybe you got a lemon.
good luck.
jeff

Terminology that you are not associated with. Get a CET my friend, then we'll talk.

As far as the heat sink goes, you and Chris (I mean Carl), seemed to have a hard-on about this so here goes nothing.

When you are designing an electronic circuit. You want to run as cool as possible. Heat is the worst enemy a component can have. You want the circuit to be able to perform at ALL LEVELS DESIGNED FOR AT ALL TIMES.

So let's just say that I designed a certain radio (HTX-10) that is to put out 25 watts or so. When I key up, I'm asking the finals in my amp stage to go into a class AB type mode and put out 25 watts of RF power with as little distortion as possible. The key here is "LITTLE AS POSSIBLE".

If I use a RF final with a maximum value (Pt/w for all you CET's out there) of 30watts, then I'm pushing the unit near maximum which distorts at 3.7db's at 28mhz. Now remember, this if the unit is running COOL. If the unit get near or exceeds Tl/c which is the temp limit, let's just say, 180' F, then you start to get distortion.

Have you ever run your linears or CB's to the point where they are hot, and then listen to how well your voice sounds and how clear you are???

That's why, when I design a circuit, I use allot of heat-sink area(metal type has allot to do with it, aluminum, copper, steal etc.) I make sure that my outputs won't be running near maximum at all times.

The HTX-10 would go into thermal shut-down right out of the box!!! 2min. of dead keying and the heatsinks are soooooo hot, down it goes.

Why do other 10 meter radios not have this problem. CAN YOU SAY SHACK???

Heat is a big problem and there are ways to fix it. But it should be done at engineering time and not at the end-user's place.

The unit I got was the only one in town. No other stores have it. If it comes back in before the sale is up, then I might try another unit. LEMONS DO HAPPEN.

I have a Radio Shack TRC-225 handheld forsale. 40 channels. Looks brand new! Comes with rubber ducky antenna. Power switch (HI and LOW). Comes with strap to put in your hands. Also the channel selector is on the side so you don't have to reach to the top to change channel. (You can use your thumb for this!).

Make an offer over $20.

Excellent question, Robert--one that should be asked more often.

If the signal is AM or CW, you can set your receiver to the CW mode and tune for "zero beat". Then read your dial/readout.

If the signal is AM or SSB, you can set your receiver to USB and tune until the voice sounds "natural". Yes, that's right--it works for AM also. When the voice sounds normal, read the dial/readout.

All of this assumes, of course, that the dial/readout is calibrated against a standard. For most of us, reading a signal to the nearest 1KHz is adequate.

By the way, using the USB mode on a weak AM signal often will work wonders.

Your second source is wrong also. Maybe you should take what you hear with a grain of salt.

>> I like standing up for people who try hard, provide customer service in a world where it is rare anymore, build a quality product in a timely manner and stand
>> behind it.
>----------
>----------
>How do you know davemade doesnt try hard, build a quality product, and stand
>behind it. Have you ever dealt with them personally? Have you ever bought
>anything from them. ? Are you going on second hand info?

If they're trying hard, then they define "hard" differently than years ago. Yes, I have used and sold Dave products. Since X-force came about, I no longer have to wait for repliesand wait for products. Unlike you, I don't repeat rumor, I deal with first hand information.

>>Ask some of the guys in here who have bought from them How they rate? Not someone who hasnt had any dealings with them.<<

I can see that people who live close to a distributor haven't had problems that they will admit. That's great, but what about the rest of the country?

>If that makes me an X-Force cheerleader, then so be it. If that's what I am, I think I'm a lot better team representative than your
>"prozac".
>----------
>----------
>What makes you any better than him? He loves his davemade amps, and is
>willing to brag about them even if he had to wait. His only affilitation
>with them is that he likes there product. I doesnt make him a bad guy.

He's an obvious idiot, are you going to deny that too? Just because he owns a Dave Made product doesn't make him a good guy, doesn't justify the fool he makes of you and himself every day here. A homeless wino loves his Boones Farm wine too, but they don't get him to do commercials!

From: Frizz <senorpurpl@hotmail.com>
Message-ID: <81qet4$hu9$1@autumn.news.rcn.net>
Source record: 13122

Here's what I want to do,
I have restrictive covenants in my neighborhood (no way to move out either, don't ask.) so I can't really put up anything big like an A-99 on the chimney and climbing one of the trees would be somewhat hard so I am wondering if I can mount a 108 inch whip on the top metal part of my chimney. If so, would the SWR match well and what should I do about heat, we are using a gas log fireplace if that helps. Is this possible? Thanks!!!!!

As a side note, I was walking near the Capitol building yesturday (l live near DC) and someone once had one mounted on a exhaust pipe. The thing was old, the mount was rusty. Could this have been CB, it looked like a 108 whip or could it have been for some other band? Oh well, thats it, thanks!

> Ask them what to do about your problem.

In one block, it doesn't matter if it's 4 watts or 400 watts. You
are going to hear your neighbor. You're bleeding on his radio, too.
There are a few spots in town where there are 3 or 4 stations within
a half mile. They stay on the same channel the others are on because
they can't hear any other channels when the others are talking.

I have met a lot of nice folks due to bleedover. I just join 'em as
they are passing thru. Sometimes I'm just passing thru.

Try to get along with your neighbor. It works wonders.

Just curious how many Pennsylvania DXer's are on the board..... Or in around the Keystone.

For the FCC inclined, since DXing is technically not allowed, I will clarify that MY personal opinion of DXing is talking no more than 2 miles away.... <grin>

Hank

MC,

How you doing?
>If you were tuned to the right frequency you would've heard me too. Was
>talking to Bucks, Lancs, Kent and E. Sussex. That's talking - not
>shouting. :->
I bet you that was on side-band!

That's not talking, that's taking the easy route:-))

There are few, if any UK stations with the capabilities to cross the
pond on AM. I hope to change that.

I used to live in Buckinghamshire, I'm now based in SW London in the
county of Surrey.

Message-ID: <01bf39ab$db7a9d20$4986c326@jfayard.ionet.net>
Source record: 13139

I wanted to get a Cherokee AH-100 for Christmas, but it seems as though that model has been either discontinued or no one stocks them anymore. Was there a problem with the AH-100 model?

Also, is the Spitfire a comparable/better unit than the AH-100?

I'm not interested in being able to tweak power on a handheld, just that I am able to connect an external antennae and have access to LSB and USB in a handheld unit.

Thanks,
Ken

Hello RH2: I sure get a kick out of your responses, but pretty predicable. In the sense of predicable, your response is of no technical help, or technically incorrect, and snotty. You got all three, way to go.
Where ya all trained to act like this, or where ya brought up this way? You sure appear to be spring loaded to snotty and technically incorrect. A lot of hams are.

I went to the TRW swap meet (Near the Los Angles Int. Airport) yesterday, and over heard a couple of elderly hams talking. They where sure discussed about the way the ham radio fraternity has turned out and all. They remember when most all the hams where friendly, and this made the hobby very attractive for new comers. Boy did they bad mouth guys like you Joe.

There's a few snotty and technically incorrect guys like you who show up at the local coffee shop. I make sure I set next to them, and correct all the wrong things they say. And the snotty part, no problem, I offered one guy $20 dollars if he could act like a real human being for just ten minuites, no takers! But he did tone it down a few dB.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station. Miss Dinah at the fillin station yells: "You SOB's whip your feet before enterin my gas station, and iffins U pick up stuff with them dirty greasy hands you bought it, Buster. Wash room outs back" U sure don't get service like this at one of them fancy "Gas & Go's fillin stations, on the main drag.

>Thanks!!!!!

Should work fine for you. This type of antenna expects a ground
plane, so make sure that you provide one if you can. A good idea would be to
use copper wire (whatever you can find, it doesn't matter - transformer wire
would work) and arrange it arround the antenna in a radial pattern. Use as
many as you can, the more the better, ultimately connecting them to the
antenna mount where it would normally attach to the car (electrically,
connected to the shield of the coax). One benefit of this installation is
that if your roof slopes downward, you'll have a relatively low(er) takeoff
angle, giving your signal better range, possibly even slightly directional
toward the direction of the roof's slope.
Heat should not be a problem,

> As a side note, I was walking near the Capitol building yesturday (l

Source record: 13146

I listed this amp once before and although there was a lot of interest, no one bought the amp. So, here it is again. I have an SB-200 amp in excellent condition with full output of 600-700 watts all bands except 10 meters. It does 350-450 watts on 10. Also tunes the WARC bands at reduced power. Has Harbach "Soft-Key" mod already installed, so the amp can be keyed with any solid state rig.

I would like have $340 for the amp and will split shipping cost. I will also consider a trade for an hf rig I can use as a mobile, since thats one of the reasons for the sale. Would prefer a Kenwood TS130, 180 or 140S in like condition.

If your interested, email to rpemers@aol.com and we can talk.

I would mount the antenna then hang a single vertical wire frome the base of the antenna. This gives a vertical dipole that has a little more gain than the groundplane antenna and would be a little less visible. If you are running low power feed it with some RG6 coax and use a antenna tunner to match the radio to this 75 ohm antenna feedline sytem.

If the LSB mod is done right it can be a decent little radio. Of course there are better radios but you get what you pay for and the HTX-100 is a good value for the money.

4823. Re: Figuring out receive freq?

I think you should add that you will need an RF signal generator for this to work. I can tell immediately if a radio is out of whack. Just tune to 27.185 on AM and tune for maximum signal. There are so many peopleon that channel that you can tune to the "average" of everyone and get a very good idea if you're on or off.

Well, it was from my car, sorry that should be "moHbEEl" so that ought to be worth some handicap points. :->

> There are few, if any UK stations with the capabilities to cross the
> pond on AM. I hope to change that.

Having spent much time in the kingdom of UK, I think it is safe to say running a very high-powered AM station (particularly of the splatter-box variety) will quickly get you well known with her magesty's post office.

My question to you, Phil, is I gather UK CB radios run FM from about 27.4125 to 27.9125, is that correct? Which channels/frequencies are most popular over there? For instnace, here channel 19 is always busy with truckers (lorry drivers). With this in mind, even when the band is wide open from here to there, I never hear any FM stations. And the stations I often talk to are running very basic equipment. Thoughts?

MC

This will work OK if you use 4 108" counterpoise radialssloping downward
slightly from the braid side of the coax at the feedpoint.Cheap
truck-driver mirror mounts work good.
>

A few inches could make it for the 10 or 12 meter ham band,no way to
tell without measuring it and it could even be a collinear VHF or UHF.

4827. Re: Radio Shack microphone

Newsgroup: rec.radio.cb

Greetings!

Neat!

Any SMDs on this Mic that you have to worry about?

One type of Power Mike from RS made for their line of 5-pin DIN CB
radios uses SMD's, and it's catalog number if 21-1177 - but it uses
2AAA type batteries.

Since you've metioned "Hearing Aid" batteries, I'm wondering if
they've changed the innards.

Wanted to know if this one used discretes versus SMD's.

While Dancing with the Mouse on Sat, 27 Nov 1999 19:45:13 GMT, the
Modem interrupted with an MNI from "MC 10kW Jesus
<qsl27@hotmail.com>", and the MotherBoard buffered this to Video RAM:

:+> This microphone is made by Merry Microphone. I like it personally. Instead
:+> of the expensive 7V battery for the unit, you can buy a pack of hearing aid
:+> batteries and use them. I forget the battery number off the top of my head,
:+> but they are the bigguns that Radio Shack sells. You can probably get them
:+> cheaper elsewhere though. When you buy them there should be no tax as they
:+> are a health product. Wrap up five of them with a small piece of sticky tape
:+> and insert. The battery cover will hold them in place. You can also modify
:+> the microphone for considerably higher output. Inside there is a 1k5
:+> resistor that forms the negative feedback for the built-in amplifier. Change
:+> this to something with a higher value, say 18k, and you'll find the output
:+> comes up in fine style! I had one that I removed both the 22n capacitors and
:+> this widened up the output bandwidth a lot. I believe that if you short the
:+> 47k resistor together you'll defeat the noise-cancelling function.
:+> Unfortunately, somebody broke into my rig and relieved me of mine. :-< I
:+> guess I'll just have to get another one.....:->
:+>
:+> In short, plenty of tricks with this mic!
:+>

Sorry dude, but that RS radio sounds very good on the air and has a good sensitivity and S/N ratio. Rec. audio is excellent. However, it suffers from a poor choice of xtal filter design thus getting "splashy" from other ssb stations on contest day. This is a 10 M radio, right? From the sounds of your post, you received a defective or poorly adjusted radio. It happens to the best of them, ie icom yaesu, kenwood. It is a hell of a radio for $150, certainly better than most if not allthe bootleg 10m radios selling out there. One rotten apple doesn't necessarily spoil the whole barrel.

<<To be honest, it sounds a little like you RHOOLIGAN are a bit jealous>>

Hey, Ice. Think of me as a microbiologist.
Is a researcher jealous of the "culture" under
his microscope? 'Course not.

So you guys just go on arguing about what
amp locks up more channels (or whatever)
and don't pay me no mind.

With a little more knowledge of what
makes the competition amp crowd tick,
perhaps someday society can find a cure!

Sorry Jay for makin fun of you a bit in my last post, but I
figured turnabout was fair play since you were sending a
few barbs my way ole boy.
Your speculation about me being a tech-head is way off.
I just happen to think CB linears are idiotic. Guess we
differ on that one.
Glad you met a few nice hams at the swap.
Tell you what, next time I go to TRW let's meet and I bet we can
cast aside all kinds of misconceptions.

Hi Andy,

As far as I know the Realistic Noise Cancelling microphone is discrete components only and uses the 7V battery. I must confess I haven't purchased one in a while so it is possible that they've changed it. Knowing Merry Microphone's products, I don't think any of them use SMDs!

MC

Snip

The C.E.T. isn't worth much if you think you're suppose to take a 25
watt PEP radio (HT-10) and run it at 25 watts.

>
>

Depends. The D104 M6B makes your audio a little "tinny". The D104 575 can be adjusted for bass and/or treble. Now the CA-75? Never played around with those mics.

When your radio is modified with the AMC disengaged or Modulation Limiter cut, the M6B would overmodulate and maybe squeal "because of its tinnyness" where as the 575 can be turned down via the mic's "volume" and the tone can be adjusted for base. Other people will have different opinions about this but that's how I look at things personally.

On the other hand, I prefer stock mic's because the use of the radios mic gain and less background in my audio. The trick for all radios is to use Cobra 148GTL/GrantXL stock mic 600 ohm'ed element because of audio quality within its coffin chasis. I don't know why that is but I get better audio quality out of that particular mic than with Power Mic's. Once again, other people might agree with me but then they might have their own opinions. Just my couple of pennies...

137... back out!

4867. Old Turner Model J-M +3 Power Mic question

Newsgroup: rec.radio.cb
Date: 1999-11-28 00:00:00 UTC
From: "J.T." <jmtsr@usa.net>
Message-ID: <Q71BOEfjRNHHXmdr=2d40a0WrET8@4ax.com>
Source record: 13252

I was wondering if anyone has ever heard of this mic. I just rounded up 2 of them for free still in the box and with all the papers untouched. They have been used a little, but they look in A++ shape. They take a 7volt Mercury battery by what the instructions say.

Specs on instructions/Manual

Conrac/Turner (turner in big letters)
Model M+3, Ceramic, Transistorized.
Gain Control: Slide action
Frequency Responce: 300 to 3500 Hz
Output Impedance: 1000 ohms
Power Supply: Ray-o-vac #1501 (or Equivalent)
Battery Drain: 0.9ma
Battery Life: 6 months
Cable: 3CIS, Coiled cord, 11" rectracted 5' extended, medium blue, Hypalon Jacket.
Weight: 260 Grams (9.2 oz.)
Case: Cycolac, light blue front, medium blue rear.

I was wondering how these sounded, if they were keepers or sale to someone that is a collector. The boxes are almost mint with manuals, padded envelope (Jetpac) for Mic, plastic that covered mic, manual, sheet with specs, and metal mic holder never out of the brown sealed bag. The price $39.95 is printed on the box.

Thanks, JT

Although they were supposed to be playing the "Watergate" tape at about 11:30pm on Saturday night, the tape was still being listened to at 2:00am when my wife and I called it a night. I'm sure Steve at EXPORTSRUS will have the results for y'all. We did have a great time there again this year and as always, met some great people! Had an even better time seeing the people we knew from past trips and having dinner with a some really nice folks! I would like to say that some of the criminal element was about as there was a Suburban and a Caddy stolen from the hotel lot on Saturday and for those people it was a sad loss seeing that there was such a good time to be had by all that things like this would happen and dampen the spirits of those involved. To those who went to Memphis for the weekend we hope you all had a great time and with some luck we (my wife and I) will be back again next year. We'll be moving back to Jersey in June and will be going to more of the northeast corner gatherings.

4872. Goldstar OS-7040 Oscilloscope 40mhz Dual Channels

Newsgroup: rec.radio.cb
Date: 1999-11-28 00:00:00 UTC
From: "J.T." <jmtsr@usa.net>
Message-ID: <nM5BOEFXrXTbzaCZrXijHNLbhL9n@4ax.com>
Source record: 13257

I got this one in excellent shape, cleaned up like a new one. Hardly used, set for years in a dry place... got it on trade for a amateur radio. Oscilloscope usually don't do so well on Ebay, so you might get a great deal? Click on the link below to see pictures, be patient on the lower picture, it's large for a reason.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=209782048

Thanks, JT

I don't know of any with information specific to that
particular amp. However, there are individuals out here
that may be able to answer any questions you might have
about it. For example, I have quite a bit of experience
with that model of amp. Feel free to e-mail me with any
questions.

4877. Re: Old Turner Model J-M +3 Power Mic question

Newsgroup: rec.radio.cb
Date: 1999-11-28 00:00:00 UTC
From: Bill Eitner <kd6tas@netzero.net>
Message-ID: <3841D94C.AB3A195D@netzero.net>
Source record: 13262

The +3 is a compression type mic that works well on SSB because the compression helps to keep your output signal at a higher average value and more stable. They have a fairly flat frequency response that doesn't make them sound very impressive on AM, and, if you're not careful about keeping the volume control as low as possible, they will pick up a lot of background noise. In other words, they are definitely not a noise-cancelling mic.

So, in a nutshell, if you're operating environment is quiet, and you use SSB a lot, they are worth keeping. If your operating environment is fairly noisy, and you're on AM most of the time, sell them.

4881. Mod for Cobra 75WXST???

Newsgroup: rec.radio.cb
Date: 1999-11-28 00:00:00 UTC
From: Tom <tomc@nospam.net>
Message-ID: <3841F160.E3ECC623@nospam.net>
Source record: 13266

My RCI 2950 won't fit in another vehicle I use, so was thinking about the Cobra 75 WXST...but I would like to give the modulation a little help, if it is even possible for this radio. None of the mod sites have it, altho I did find it's predecessor, the Cobra HH70, which had a pot that adjusted modulation (but it didn't have Sound Tracker circuitry).

So I have two requests.

(1) I would appreciate hearing from anyone--who has actually identified the pot or VR for the AMC--on this rig.

(2) I would also like to hear reports about the performance of the 75 WXST from anyone who has used one. Does it even need the mod???

To respond by email, change the "nospam" in the address to "mediaone."

Thanks and 73s to all.

I stand corrected, 29.620. Thnxs QRM2000. I tried to hit the repeater about 5 min ago but nogo. The conditions are not good right now at this time of the day-cycle.

I also just tried #39 (27.395) and was pushing 250 watts with swing on LSB but nogo. I might need a beam for that one.

Anybody want to try 28.000 FM or AM??? I'm pushing plenty but the CB activity is to much around this area.

73's and QSL, Jason

talking on
> the phone ! Split frequency and drive your friends crazy !!!!

Yes, that is split frequency, and it is fun to do especially if someone is trying to jam you. But a repeater would have to transmit AND receive at the same time. That is what full duplex is. Channels 25 and 4 are too close together and the transmit would overload your receiver and you wouldn't hear anyone. It's called receiver desensitization. It would be like having 2 CB radios connected to each other thru the coax. Transmitting on one CB would desense or even damage the receiver in the other CB even if you were on different channels. Repeaters usually use resonant cavity duplexers which attenuate the transmit frequency in the receiver which allows you to TX and RX at the same time without affecting your RX. They are also used to ensure the antenna is only transmitting the desired frequency and all other frequencies "bleedover" are attenuated. This is how many of the repeaters in the 10 meter and VHF/UHF bands are set up. There are lots of 10 meter ham FM repeaters in the 29.500 thru 29.690 area if you can receive them. They receive 100kHz down from the transmitted frequency.

Using phone lines or 900 Mhz phones to separate the RX and TX might work, but you would have to have a way to tell the transmitter to key up when someone is on the receive frequency. VOX (voice operated transmit) might work if your transmitter has it.

Robert

4894. CALL SIGNS/NUMBERS!

Alright. I see occasional postings of those who wish to show others their call sign/numbers to the group, but ever so occasional. I am going to start this off now.... I believe it would be a great turn out as long as many participate.

"148" in VA State
27.395 LSB/USB
27.385 LSB/USB
28.215 (I only listen on this frequency) <g>

I usually tend to stay on LSB myself..... Anyway, just doing something like I have done will help me compile a list so I know what numbers to start throwing/asking for. Take care.

Hank

Someone
> mentioned the chipswitch? Would this help?

I would like to offer something here.
When the 2510 came out I noticed they had a problem in the
receiver that allowed strong stations to ride in on top of any other
channel I was on. The problem manifested itself as a weaker but
perfectly readable audio of the interfering signal coming in with
the intended signal.
What I found to be the problem was a lack of isolation between
the input and output leads of the IF filter. I installed a shield
between and over the printed circuit side of the filter and this
about completely stopped the problem. I also noticed the filter
didn't have a good match on the input or output. Sorta' like a bad
swr if you will. I added a couple of resistive impedance matching
networks to the in/out leads to give the filter a somewhat better
match to the remainder of the circuit. This cut down on the IF
signal about 1-1.5 db but the loss was not bothersome.
Before you try one of those other filter units why don't you try
adding at least the shield and see if that cures your problem.
Now that I think about it some more I also noticed there was a
problem with cross modulation in the rf amp/1st mixer. This isn't
that hard to cure either.
The problem will manifest itself as an imposed audio on the
wanted signal whenever at least two close by stations are on the
air. You can test for this by incorporating a switchable attenuator
in between the rcv and the antenna. If you switch in, say, 10 or 15
db and the problem goes away you might be suffering from cross modul
ation.
The cure might be as simple as replacing the rf amp transistor
or perhaps one of the input protection diodes is defective allowing
a very strong signal to reach the rf amp without benefit of agc
derived attenuation.

Naturally, without seeing or hearing the radio it is difficult
to diagnose. But maybe these ideas will allow you to investigate
further.
Good hunting. BobC

news:384089CF.5DA89941@hotmail.com...
> This could be a two-way clarifier modification gone terribly
wrong. Seen this
> before.
>

I didn't catch the original poster's question or any info
pertaining to the nature of the off freq op or whether this is the
858 chassis or the 8719 chassis. I'll address both.
If the freq. is off but the channel selector is working
correctly then you will need to touch up some trimmers.
Assuming the clarifier is modified, make sure the voltage
leaving the clarifier control is steady. I'm talking about no more
than a few millivolts change from keyed to unkeyed. If it changes
more than that you need to troubleshoot down to the regulator to
find out why this is happening.
If the clarifier has not been modified then you will need to set
the tx frequency control pot to the same freq as the rcv. Ideally
you would have a way of counting the frequency of the xtal osc. that
the clarifier controls. If not, then you'll need to monitor the
voltage at the point where the clarifier and the factory set tx
frequency pot are summed towards the xtal osc they control. This
will be at the point where the two isolation diodes are connected.
Again, you don't want the voltage to change at all between tx and
rcv.
You will want to check the reference osc. frequency of 10.240
making sure it's ok and not changing for any reason.
If this is a 858 chassis, you'll have three xtals do deal with.
One for lsb, one for usb and one for am rcv. If it's a 8719 chassis
you'll only have one xtal to deal with.
These are not difficult adjustments to make provided you have at
least a good counter or voltmeter and a schematic.
If you are unable to fix the problem using everyone else's
information supplied here than email me with more specifics and I'll
try to walk you thru it. Let me know which chassis it is, the test
equipment you have and what exactly is going wrong.
Good luck. BobC

4897. Re: MOBILE ANTENNA?? to close together?

Newsgroup: rec.radio.cb
Date: 1999-11-28 00:00:00 UTC
From: castle22@webtv.net

Source record: 13282

how serious are you about your cb radio??
--MORE concerned with talking distance,or looks of your truck??
putting a ball mount in the side of your truck, would not be very smart......You would be VERY directional toward the front, and your transmit,and recieve toward the back would suffer a great deal........ The same goes for the dual 102" whips ,+ that looks like crap!! Let me remind you 102", is 8.1/2 feet . You said before that you are going to be near low trees. Those antennas will hit EVERYTHING in the woods.............I suggest going with the Wilson 1000 magnetic mount. Put it in the center of the roof, right between the front seats.........This antenna is BUILT to take a beating, and mounting it in this location will give you the best all-around transmit and recieve,.........& it doesn't look like crap!!!! It is a little expensive, but it works very well.................. Buy it!!! , You can thank me later.........

There isn't a radio that will stop the splash from that. The only thing that will help is using a beam on the flat side and in the opposite direction. Even that might not help so much with guys like that.

I need help!!! I have a guy about 1 block away from my house who has a CB and is running about 500 watts on AM. My poor 2510 can hear this prick from 26.000 - 28.000 when he is on the air...Is there anything I can due to cut down the splash? Will it kill my radio's sensitivity for shooting skip? (That is pretty much ALL I do on the radio) Someone mentioned the chipswitch? Would this help?

I'm ready to get sell this rig, if I can find a better radio that isn't such a splashbox...Any suggestions?

Greetings!

I agree with your statement about the quality of Stock mikes.

It's the fidelity, I guess.

And re-work some of the Mic Gain section makes using the "Stock"
microphone well worth it. Simply because of the price of parts for the
change is listed in cents, not in Tens and Twenties.

While Dancing with the Mouse on Sun, 28 Nov 1999 15:48:31 -0800, the
Modem interrupted with an MNI from ""Mr. 137"
<ac137nospam@iwvisp.com>", and the MotherBoard buffered this to Video

Source record: 13296

I found this website ran by Panther Co and they have a mod to increase the receive for the DX 2517. First I like to know if the RCI-2980 has the same internal board. Second I am trying to locate D30 and D31 without the help of a schematic. Can someone help me locate these two diodes by giving me other part # that are next to them. I think I found D30 but part of the 0 is covered up and could be D36 this is located next to a crystal in the lower left hand side next to IC10 end closest to front of radio. I also have found what I believe to be D31 but could be D37 close to VR 7. Does this mod work well enough for me to do the job? Please E-Mail me direct. My radios serial# is 903918 I can't find the Circuit board # and have to assume this is the EPT690010Z board . Any help appreciated

>These guys are running only 50 watts and thats on FM too. One guy called
>in from Salem, Mass.
>

Just thinking.....could that frequency have been 29.620? You would be more likely to hear FM in that spot.

And, if it IS 29.620, be aware that this is a repeater output frequency. When the band is HOT, you will hear folks from all over the world -- not necessarily through the same repeater. It is a weird effect as you hear repeaters fade in and out.

mdwade has noted:
Got an exhaust brake on Pickup, Dodge Diesel 2500, and in Canada, Jake
Brakes are prohibited for use in populoated areas. Got warning from
RMCP when he heard it coming down the Mt in BC. Works great.

Dear John:
You better hop over to www.thomas.gov and look up HB2346 which is in the
telecommunications subcomitte in basket. Mr. Billy Tauzin (R-3LA) is in
charge and the local cities are getting him warmed up for this one.

>
>Motorola offering SSB HF 1.6-30 Mhz. Interesting, Lotsa Bucks I Bet!
>

LOTS of bucks! Also not suitable for use on 10 or 11 meters ONLY. You will
get better receiver characteristics in a single-band radio which doesn't have
to compromise performance to cover 1.6 to 30 MHz.

Also be aware that the Motorola SSB unit is designed for channelized operation,
such as in the ship-to-shore and air to ground services. It is awkward to
"tune" up and down through a band segment looking for random contacts.

On the plus side, it will last FOREVER!

QRM

4934. Verne's Super Antennas Page Updated

Newsgroup: rec.radio.cb
Date: 1999-11-29 00:00:00 UTC
From: jparker@fix.net
Message-ID: <3841fb2f.5256544@news.fix.net>
Source record: 13353

W6MMA's Super Antennas page has new pictures of both

his KW3 mobile antennas and the PW-1 portable antenna.

Please be patient as the page loads slow due to all the

graphics but it will be worth the wait.

Foxie's 4 pill didn't do the job, cause I myself took it out when I was on the line for 2 hours straight winning. Don't know about the other classes.

Agreed. No we are not going out of business, instead we are growing again. We did shut down the business Thursday, Friday, Saturday, and Sunday, went to memphis and stayed on the line winning for 2 hours at the shoot out with our X Force 4 pill. Batteries got low and lost after tieing with AT&T for the final. 11 vehicles in all is what the Mini Van, X Force Box, and "55" built antennas took out. As of Monday, business is back to normal. Thanks for the thought.

That's a early C-band satelite dish rotor power
supply,maybe with a directional control switch which is a
polarity reversal switch.
Good for use as a 36 volt power supply at fairly low
current.

Planning on buying a CB when I get my new truck soon (can't drive a 4x4 without one) but I was wondering about the quality of new radios compared to older used ones. It seems like everything these days is made cheaply, to be replaced in a couple of years (hope my new truck won't be like that :-) Any thoughts?

4946. Re: HTX-10, Major piece of CRAP!!!

Source record: 13365

Methinks Mr. Anderson may have indeed ended up with a "problem
child" w/"infant mortality" problems.

I ran my HTX10 into a Cantenna, thru a Kenwood antenna tuner
w/switch, SWR & wattmeter - interested in how hot the final
fins would get. FM mode, keydown for 1 minute; fins "warm-hot",
a little less than that of my 50W 2m rig. Best I can tell
from the small meter face was that it put about 28W out (it
could be 25-30W).

Can't yet speak to frequency issues. Since the "clarifier" seems
to be always active (i.e., not switchable in/out, you need to keep
it centered. And if it's not on-freq w/centered clarifier, the
4.5MHz ref osc/clock osc for the PLL/CPU needs to be adjusted so
it's on-freq w/clar. centered. An index dot or strong detent for
the "null" setting on the clarifier would have been nice here.

The HTX10 will never be a 10M Kenwood 940S. But if it's not
failed "customer QC" ;-) it's a nifty little rig.

A couple of thoughts :
1. Try and reason with the other fella and work something out.
2. Failing that get an equally large amp, give that a go for a while and then try option one again
3. When all else fails do what we have been known to do here in 43 division - either pin his coax (a whole heap of dead shorts in his coax will kill that amp pretty dead) or alternatively you can hook your 4wd (I think you guys call them RV's) to his tower and go for a quick drive down the road. If you are lucky you can get a radio or an amp to follow behind your car. This will maybe not solve the problem but will certainly register your disapproval!!

They are definitely keepers!
They were among the best in their day from Turner and continue
to be very comparable to today's power mics.
The only thing you might need to do, depending on the switching
needs of your radio, is to rewire the switches to work on your rig.
Many of these had only one wire to ground for ptt and no provision
for grounding the other leads for rcv. You may need to add the grnd
to the other leads for rcv. No big deal.
Sound wise, these mics tended to be a bit on the high pitched
side but if you keep the gain down to a nominal level, will sound
great in a vehicle.
About the only thing that went wrong with them was the dirt
would get into the slide control and the battery terminals would get
a little dirty once in awhile. No problem.

Well like everything else in ten years it too will be old and the best made
compared to the new stuff.

A radio, regardless of what year it was made, will last a good long while. If
it is taken care of properly. If abused then you may have to replace it in a
couple of years.
Just like your 4x4. Take care of it and it will last you a while.

How did you like all that talk around.

But really if you can find a good radio used then go for it. Depends on how
much you want to spend. Beware of the radio's that may have been hacked up.
Spend wisely and have a good time.

Well hello, Jeff. Why are you posting your comments about the hams in
rec.radio.cb in the rec.radio.amateur.misc newsgroup? Were you hoping
the hams in rec.radio.cb would not see it?

Don't worry, I'll post a copy of this in rec.radio.cb so that the ham
operators in that newsgroup won't miss what you've been saying about
them behind their backs.

Hello Dwight: Maybe we should also post a bunch of stuff on rec.misc. But there's already way to much animosity going on there now.

Besides, what you reposted, Jeff has said it here many times. It kind of boils down to "WHO CARES". I am sure you can go back and run off new ham radio prospects on rec.misc all by yourself.

Which is why Amateurs respectfully ask unlicensed persons to refrain from transmitting in the ham bands. Besides the legal issue, you can think you are on simplex, or you're calling someone you hear, and you never realize you are being rebroadcast over a repeater.

There also are space stations operating in the 10 Meter band. It is easy to cause harm without realizing it.

28.000 would cause harmful interference to Amateur CW stations.

As another responder requested, please don't transmit above 28.0 unless you are licensed. This portion of the spectrum is populated by CW, SSB, Beacons, and space stations. It is very easy to cause great harm by transmitting on what you believed was an "empty" frequency.

The vacating of the CB bands by high-powered stations in other radio services was what allowed the Citizens Band to be created and to grow (and later to be expanded from 23 to 40 channels). CBers want other services to respect 11 Meters and not cause interference to CB communications. It is hoped that CBers, in turn, will respect the frequency assignments of others.

Remember, self-government won't work without self-discipline.

Bill,

You obviously don't understand how a Noise Cancelling Mic works...

What they do is generally have TWO elements. The idea is they
both pick up all the noise in the environment. The two signals are
subtracted from each other. The net result is that noise that hits
both elements the same is actually reduced. When you talk into
the mic, you are closer to one element than the other. By their
nature, you have to get right on these mics to make them work
so that you talk into one element very stongly compared to how
your voice hits the other element.

The fact that it's a 'power mic' has nothing to do with the fact that
it is 'noise canceling'.

Mike

Ever listened to your scanner and notice the chirps, tones, buzzes and beeps heard during transmissions between either police, fire / rescue?

Ever imagined of having a circuit to duplicate that -through your CB and listen to the responses you'll get from others who are curious as to how/where you
got that catchy sound -compared to the jealous remarks as to describing you as a dispatcher wannabe from "the locals" who don't even know who the hell you are anyway
and couldn't careless if you knew them or not,

And some of them are either highschool teenagers showing off in front of their girlfriends or their "good buddies" or just some low-life who hangs out at every business in town
just to catch up on who's dating who so they can execute the plan of operation to win your girlfriend over by telling lies about you and hanging all over your girlfriend just to show you down in front of the town-folk and your friends who
are going to be at your wedding in a couple of days.
Sound Familiar!!
It Does Happen!!

Forget Them! They're Choosing Jealousy OVER getting a "Reality-Check"!

I am looking for a circuit / chip that will allow such tones to be emitted before and/or after transmission.

Any ideas?

Tnx & 73s

You Know Who Said It :)

Calm down, Dwight, try to recruit not drive off people.
ur overzealous attitude will only turn off people. There a lot of
cultural differences between CB and HAM, try to understand them.
(IT AIN'T THAT FAR APART, REALLY) Many hams started with CB and still
use CB (I BES ONE), so lighten up, trun off the ego and try and listen,
ypou might learn how to recruit (A SALESMAN U AIN"T).

73 de Martin N%PZJ Advanced CLASS
1. remember, in life, have class, not clASS.
2 to get friends, be a friend
3. it is nice to be important but its more important to be nice.

But do they full duplex or half duplex. I think you might be talking about split frequency which is half duplex. Talking on one frequency and listening on another frequency. This would enable you to use repeaters, but it would not allow your radio to become a repeater. I have a handheld radio which has the 144MHz and 440MHz bands, and the frequencies are far enough apart that I can set up the radio to be an actual repeater. It's called a crossband repeater. I can sit back and watch one person transmit on 144Mhz and the radio will begin transmitting simultaneously on 440Mhz. And vice versa when someone transmits on 440. But the difference between the TX and RX freqs is 296 MHz, which is enough for someone to use the same antenna to TX and RX at the same time without interference.

>Auchtung Ver Botten! <-PLL02A and Hams Again

> my
>> chances of joining the ranks of amateur
>> operators is about as good as my
>> joining a neo-nazi or faciest or communist
>> organization. NILL!!!
jeff

thank you for proving my point. need i say more?

YES!!!

>Why are you posting your comments about the hams in
>rec.radio.cb in the rec.radio.amateur.misc newsgroup? Were you hoping
>the hams in rec.radio.cb would not see it?

no, as a matter of fact, if i were worried about that, i would have sent it as a private e-mail. i felt, and still do feel, that what i said needed to be said as it was pertenent to the conversation.

>>Don't worry, I'll post a copy of this in rec.radio.cb so that the ham
>>operators in that newsgroup won't miss what you've been saying about
>>them behind their backs.

thank you for saving me the trouble.
if the post that i was responding to were on rec.cb, you wouldn't have had to go to the trouble as it wouldn't have changed anything as to it's content.

>> if there's a jammer out there, bitching
>> about it on these ng's is NOT the place
>>to get it fixed. take it to the FCC.
>> same with rec.cb.
>> if there is an out-band or power problem.

>> a lot of agression against the ham >>community as a
>> whole even when it is not deserved by
>> everyone in the community.

>> a group of people that could be
>> friendly and have a good time.

>> I WILL BE THE FIRST TO SAY THAT NOT ALL HAMS ARE THIS WAY!!!

>> the basic premis of ham is very attractive

>> should it improve, i'll be the first in
>> line to get my ticket.

HERE'S THE UPSIDE.

i presented a discaimer that not all hams were involved in the problem. i gave constructive resourses to utilize to aleveiate their distress. also, i said that the ham hobby IS attractive so as to not disparage the basic idea of the ham hobby.
i even admitted that i would someday like to get my ticket too in the event that some changes occur.
THIS IS NOT TO SAY THAT HAM SHOULD CHANGE JUST FOR ME.
i'm only saying that i will sit patiently on the out-bands and wait. if things don't change, i'm content to stay where i'm at.

HERE'S THE DOWN SIDE.

>> you should go to rec.radio.cb.
>> all of the posts there from the RF police
>> who try to shove their opinions down
>> the throats of the cb'ers there make
>> them sound like a bunch of goose stepping,
>> lock necked idiots that would chase a dog from a gut wagon. the way they act
>> definitly isn't conducive to ham recruting.

>> i've told them that if they were asshole
>> salesmen, i wouldn't buy one from them
>> if they had the only one that i needed.

>> people need to learn to temper live and
>> let live with taking their complaints
>> through the proper channels.

>> but the class of the majority of the
>> people that show themselves on these ng's
>> makes it look like an ugly hate group.
>> it's a very sad situation that is slowly
>> poisoning the hobby to death.

as a ham that holds the views that you do, (for which you are entitled), i don't expect you to accept that there are more downs than ups here or admit that these things actually go on here but, these are the facts, like it or not.

just for your entertainment, i'll post this to rec.misc. in it's entirety so the people there can get a more balanced view of how the RF police try to stifle communications in any form through intimidation or a weak attempt at embarasment as you have here, (it didn't work), RF or the net, by anyone who doesn't conform the the laws set down by the RF police.
i only make one request. please, next time, post the original letter that i responded to so that the people here can get the point behind what i'm saying instead of taking things out of context and leaving them to wonder what the hell you're talking about or mis-construing what i'm actually trying to say.
believe it or not, most people here are adult enough to form their own opinions, pro or con, or draw their own conclusions without the benefit of your biases.
on top of that, one of the guidelines, which i admit i've broken a few here, asks that we keep cross-posting to a minimum. this is what i tried to do.
rec.misc is a separate forum to which i posted a response to a posting there.
by bringing it here, it appears that you get troll of the year award for breaking the crust on the top of the shit pot here.
the crust had hardened here several weeks ago and the stink had pretty much gone away here but you had to come in with a hammer and a spoon and stir things up.
i'm rested and up to the fight that you've brought here if your interested in continuing it. i went to rec.misc. and expressed my views so as to spare the people here the verbal bloodshed that occured here several months ago but you had to use your drag and drop to bring it here.
no one ever said that the hams couldn't go to rec.misc and look around. at the very least, you could have posted something like "hey, look here" and directed people to it instead of faning the fires of discontent in this ng. this is what i was trying to avoid for the sake of everyone here.
everyone here thanks you for your input and warming up this ng for the winter season. it will save a lot on energy bills.

> Don't worry, I'll post a copy of this in rec.radio.cb so that the ham
>operators in that newsgroup won't miss what you've been saying about

>them behind their backs.
>
>Dwight Stewart
>

it seems that YOU are the one that is lumping all hams into one pile, NOT me.

>> I WILL BE THE FIRST TO SAY THAT NOT
>> ALL HAMS ARE THIS WAY!!!

another problem with your slanting, rantings is the fact that this is the FIRST and LAST time that i've gone to rec.misc.the only other ng. that i've gone to has been rec.amateur to which i've ONLY posted answers to questions and, in one case, asked several questions about FCC and Canadian regs. i worded those questions carefully so as to NOT inflame ANYONE and i got several answers from several hams who's attitude in no way resembled the attitude of the RF police here. it was refreshing.

you try to make it look like i've been trolling the other news groups JUST to stab the ham community in the back.
this display is totally untrue. in case you don't remember the firestorm of a few months ago, if i have something to say to ANYONE, i'll come to them up front, eye to eye and say it. i had been complaining about RF police blindsiding here for quite a while and don't intend to start being a hypocrit and do it myself.
even though i don't agree with your's or other like minded views, i welcome any dialog in my mail box. it's always open. it's easier than having to search the news group to find alternative views and defend myself against attacks for my posts. this is what i reffer to as blindsiding. this is why i click the "e-mail" box unless otherwise asked not to.
the only thing that i consider spam in my mail is from unsolicited commerical interests trying to sell me something as i wouldn't buy anything from the net.
next time, at least try to post things in their entirety so as to give everyone a FULL view as to what is going on instead of bending things to fit your opinion.
thank you and have a good day.
jeff

a chipswitch won't help you as it is just a different processor.
you might try a channel guard obtainable from cbc international or maybe crb
research. both have a web site. all it is, is an extra IF filter that you can
install to make your receiver band pass tighter.
good luck.

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 40.00 plus shipping.

A Picture can be e-mailed.

I mounted my switches next to the speaker on the case on my Grant XL. I have 3 switches for my X-tra channels, 1 switch for my 10k jump, one to turn my talkback on and off. (Need it off with the amp on), and 2 dials for my galaxy echo/VC/Robot board and one for Varible power. They are all mounted on the bottom of the radio. It all depends if you want to drill any holes in the case of your radio or not. I had an old case for mine so I wasn't to worried about drilling any holes in mine. Hope this helps. For some killer mods and a way easy Channel mod for the grant XL visit my web site at http://members.aol.com/oneqck76ta/cbradio

> And we've answered that question many times before, Jeff.

yes, but if it isn't answered accuratly or truthfully, it is at best, worthless, or at worst, damaging.
there have been many postings here by the more, shall we say, agressive hams that were outright fabrications. example:

the posts that threaten to turn over e-mail addresses or posts to the FCC that discuss cb mods or amps.
this is bullshit as it is only hearsay and can not be acted upon bu the FCC as their case would fall apart in the first 15 minutes of the law suit brought against them for lack of probable cause.
if the FCC were to come and ATTEMPT to inspect my station PURELY on someones say so because of a posting here, i would soepina the name of the person that turned it in and make that person defend his evidence and charges in court or face prosecution for malicious prosecution as they would be making charges against me, sight unseen with no hard evidence other than a shitty attitude and a difference of opinion.

there are also some who try to put out the impression that happy hollingsworth will jump to their beck and call so as to suggest that the first time someone keys on an illegal radio, the FCC will be standing on their door bell before the key click dies.

these things just lead to either paranoia for the people who don't know the FCC's agenda or laughter for the people who do.

> Many of our
>old friends still only have CB radios, so we keep our CB around to talk
>to them.

good for you. so what's your point?

> And we've addressed this also, Jeff. None of use has ever said that
>CB is bad, only that there are some illegal users who make it bad for
>everyone else.

on the flip side, there are SOME hams here who abuse us unfairly and make it bad for some of us here.
> When you apply those same standards to yourself, we'll follow your
>lead, Jeff.

PROMISE???
i don't start the shit here, i just try to clean it up to you can't put this one on me.
i don't post inflamatory comments here, i just answer them.

> You're the one in here ranting about ham operators.

and YOU and the rest of the RF police are the ones that are ranting about cb'ers, so what's your point?
you and your ilk are the ones who started the conversation.
before the shit hit the fan, there haden't been one single post complaining about hams and their activities as your operations are none of our business.
you've brought this upon yourselves.

>If you
>can't help someone

i try to. i post answers, when i have them, to peoples problems. i also try to counter the RF police's contention and attitude that they have a God given right to control other peoples lives.

>don't like the subject matter,

i don't like yours and you don't like mine.
even score on this one except for one fact.
you've brought your arguement to a forum that doesn't have a whole lot of sympathy for your cause. it's like campaigning your political views in the other partys headquarters. it is wise policy to come as an ambassator than a warrior so as not to generate ill feelings when you first walk in the other guy's camp.
it wouldn't make much sense if i were to go to rec.amateur and start touting my pro-out-band views there. it would just be an invitation to be the guest of honor at a firing squad which is exactly what happens to you and yours here. i mean it just stands to reason that you don't stand in the middle of a battle field, outnumbered and tell the enemy just how stupid you think he really is.

>or don't have
>anything positive to contribute

ah, but i do, you and your ilk are the "voice of rightiousness". i add some balance to the mix for opposing view points. i thought this is what has made this country great. not the attempts of the RF police to stiffle opposing viewpoints or the free flow of information that this country was founded on. does the first ammendment ring a bell?
you may say that i am trying to sitffle you and yours with my position. if a hate group were to come in and try to intimidate some minority and the government came in to stop them. would the government be violating the free speech rights of the hate group? i think not as the government is recognizing more and more that NO ONE has the right to inflict their views on someone else. there really is a line between the existance of opposing view points and the victimization of one group by another. the supporters of your position have brought the fight here to our yard so i would say that WE are the ones being oppressed. NOT you. you are the minority that is attempting to take control of the majority. NOT!!!
in case you haven't noticed, if you try to read my posts and the post that i'm responding to carefully and, for a moment, with an open mind, you'll find several things about me that i think you've missed.

1) there have been several non-agressive dialogs between myself and other hams who don't share my viewpoint. as long as they come into the conversation in a non-threatening manor, i do not attack them. we may part ways and still not agree with each other but at least we parted on a friendly basis.

2) there have been times that i have gotten very agressive but only with people who have taken an attitude with me.
just like any other battle, you always try to use a little more fire power than the other guy. otherwise you wind up in stalemate and acheive nothing. if we wern't out to change minds or support our respective positions, we wouldn't be having this conversation right now, would we?

3) if i happen to get an ACCURATE piece of information that is in conflict with my views, and this has happened believe it or not with the help of hams, i accept it and stop trying to defend that particular viewpoint with the use of deflection, side stepping and outright bullshit as has happened here at the hands of the RF police. it seems that when confronted by facts that oppose their position, they run out of things to say so they start to attack other things like spelling, grammer, your education and, in some cases, even your mother, (in my case). when i request that they leave my mother out of the arguement as she is no longer on this planet to defend herself, i admit that they DO have the decentcey to respect my request.

several weeks ago, i got a lot of information from Martin, mdwade@mobiletel, an extra class licensed ham, about the FCC and the ITU. he provided useable references to look up. some supported my position and some did not. i've accepted the opposing information and have not used any of it as an arguement in support of my position as this would be a lie.
i posted it here in it's entirety, (i will post it again at the end of this post for your inspection), for the inspection by everyone in the ng. the next thing you know, the RF police came in like a pack of dogs and attacked one of their own apparently without checking his references first because they were still clinging to their party lines with all of their might in the face of facts that showed that, in some cases, they were wrong. all because the facts presented to them opposed their own opinions.
have a good day.
jeff

Jeff,
the interconnection between countries on ANY type of telcommunications
is overseen by the ITU, The ITU was founded in 1859 to standardize
telegraph connections between European countries as to allow for the
rapid passing of traffic or messages. With invention of Telephone and
radio, the ITU assumed duties in regards with the Cairo Conferance of
1906 which set up an international standards committee which came up
with the phonetic allocation scheme (K,N, and W along with AA to AK for
the US, G and M for the UK, D for Germany, I for Italy and so on).
The ITU regulates the international usage of telephone, telegraph, data,
radio etc. It became a dept of the UN when the UN was founded in 1945
and before that it was under the League of Nations in Geneva,
Switzerland. The ITU is called a specialized dept of the UN and the
Telephone money is a great source of revenue for some small countries.
Radio is included since international conferences have delgated radio to
the IYU since 1906. The IYU has set up the international allocations in
regard to Marine, Business, military, amateur, radio telephone, medical
devices and other radio services. The standard ITU agreement cover any
type of electronic communication and is many pages long with technical
BS from DC to Light. Every country on this planet has signed the ITU
agreement since international interconnection depends on ITU
standarization. Some countries are not close followers of ITU and some
have no central functioning governments but those that do (about 99
percent of the world) want that telephone money.

The FCC administers the Civilian Portion of this program in the US and
the NTIA (see www.ntia.gov) allocates usuage in the US for government
and military usage on the Federal Level. (Some of freeband is NTIA
stuff!). The FCC and FBI have concurrant jurisdiction with NTIA stuff.
SCARY...

On the International level, ITU allocations differ from region to
region, most of the Western Hemishpere is in Region 2 (Ham Test
Question). CB radio in North America (Canada and the US) is 40 channel
AM type emission (called A3 in ITU parlance) with a limitation imposed
by only the countries themselves. In Cntral and South America, These so
called export radios can be used on different channels since each
country can set their own standards. (Hint: 26 to 28 Mhz around the

world has been allocated to individual countries usuage, so each country may set up its own type of radio service as it wants). The high power stations from the south are mainly business types since VHF and UHF radio are so expensive. Costa Rica allows usuage of up to 100 watts ERP on Radio Personal which is their name for CB. Belize allows Business usage radio upto 35 watts on CB with extra channels available. This will shed some light on why CB is low priority with the FCC. The only beef I could see with this arrange and the ITU is that the ITU agreement states that the general usuage band we call CB can not be used for international contacts. Unless some country complains, the FCC will only pay minimal duty to the CB Band, however, some countries have been complaining about our CB and Ham Bands which I think has sparked the current round of enforcement. CUBA has complained about interference to its ham nets and repeater systems (We do pay some attention to Cuba since most Carribean telephone and microwave links pass by and through CUBA by international agreement from Florida).

I would recommend looking at the FCC website, searching the UN and ITU with search engines, The ARRL has a portion (chapter) of the rulebook outlining the ITU and relationships.

The main reason I got an Amateur Radio License was to communicate with home and almost every country honors an Amateur license without fail, however, there may be some bookwork involved but recip licenses can be obtained and it clears the path for you to carry radio gear in some countries which have a different view about 2 way radio.

In Columbia, CB radios are illegal without licensure and possession of unauthorized radios will put you on a collision course with the local gendarmes. Had a friend who was a radio hobbist who worked in Columbia on a Drilling Rig in the Jungle. He brought his scanner and 2950 10/11meter radio and got through customs (Oil drilling equipment) but on the rig, his radio skip chasing got quick notice form the Columbian Authorities (HOW? I really don't know, but I suspect drug/guerilla fighting). The legal hassle without a license cost him his job and expulsion from the country. He was asked, he told them he was a Ham and they asked for a licnese and found he wasn't licensed for Ham in the US, he was told he would have been eligible for a reciprical license but illegal operations were another thing. A $100,000 a year job lost.

Hmmm Now X-Force said it was the motorola Book, a few others said it was some other bullshit, which is it? can we get this correct. Steve, How would you really know the truth. Please show me some proof perhaps a picture of a brewer amp with daves current design. So let the truth be know and prove it other than bullshitting it.

4992. HTX-10 : OK MAYBE NOT A MAJOR PIECE OF CRAP: Please read.

Newsgroup: rec.radio.cb
Date: 1999-11-29 00:00:00 UTC
From: Jason Anderson <jason@montero4x4.com>
Message-ID: <r%z04.23$CP6.6421@typhoon-la.pbi.net>
Source record: 13411

Since my last post about the HTX-10 that I bought last Wed. only to watch it die and was returned on Fri, I've gotten allot of heat for my complaints about the radio. Especially from Chris (or was it Bill or Carl???) and others slamming me for talking bad about a fine piece of engineering. I DID admit that maybe I got a LEMON, but that was the only one in the area that I could get.

Well, Sat night, I was in another major area and called a few Shacks on my cell and found one store that just received one that morning. So I stopped by and picked it up.

Chris, thought that I botched up the radio by turning every pot on the board and fucked it up myself. So for this test, I decided to leave it stock, take all the measurements and give you all a report. So here goes.

Nov28, Sunday :8:35pm PST.
Unit tested: HTX-10
Equipment tested on:
Leader Digital O-Scope/ Vectorscope (Waveforms) Model: Lt-1590
Elco Digital Audio Generator w/built in freq counter. Model:SG-9500: 10khz-300mhz
B&K Spectrum Analyzer: 150khz-1030mhz w/ 10hz resolution: Model: BK2630A
HP- RF Distortion and SWR/mw Meter: 1.8-500mhz : Model: HPi70555L
Sunco Digital Power Supply/ Dual Outputs 1-36v adj. 0-8amps adj. :Model: 890

Ok, the HTX-10 was tested using 14.4volts since this is was a car's electrical system will be putting out. Remember, this is a mobile unit. All readings hereafter are assumed at 14.4volts.

On the bench, with the unit on, it was pulling .4 amps (400miliamps) with no volume. At full volume with squelch down, it was doing .9 amps.

Scanning, keypressing, and mode changing affected amp draw only slightly.

IF Rejection according to the manual is 70db or better, but tests showed that it started early at 48db's (48.74 to be precise) so that's not as good as the industry standard or what Tandy says.

Sensitivity is supposed to be .5uV for 10db S/N ratio. It was actually better then Tandy stated at .3mV at 4 1/2 db S/N so this is a good receiver in this unit.

TRANSMITTER SECTION !!! MY FAVORITE.
My friend KE6PKI in Downey helped me on this one.

Power Output is 7w(AM), 25w (FM,SSB).... NOT!!
On FM, power was at a disappointing 17 watts with SSB swinging up to 23

watts. Amperage draw was only 3.5 amps at full rated power. On a dead key at freq. 29.000, the heat-sink would get hot after 4 1/2 minutes!! Much better then my first one at 2mins then shut down. It would take 7 for the finals to go into thermal shutdown and about 1min or so to cool enough to operate again. But with a normal conversation, the unit would keep up with no problem.

On AM, power was at 5 watts with little distortion. and the heat-sinks were more then adequate at this power level.

When we cranked up the power to go at the rated output, amperage was a little higher and it got hotter quicker but still sounded good.

Distortion is at 5%..... Very true
If the unit is stock and putting out under rated power, the distortion is at way below what Tandy says. Actually, it was around 2.5-3% instead of the 5%. Very nice and clean. Again, the amp section on this radio is very nice.

Deviation +or- 2khz.....Wrong, or at least on my unit.
The freq that was being generated by the VFO inside the unit was off by about 4 to5khz depending on where I was on the freq range. At 28.000, it was 2-3khz off and at 29.600, it was off close to 5khz. If you were to transmit on 29.000, you were actually high at 29.004 or 5. This was kind of disappointing since this much off can cause problems in the conversation.

As with the Spurious Emissions and S/N ratio on the transmitter, they were all within range.

FINAL THOUGHTS ON THE UNIT.

For the sale price of $139, this would seem like a good unit for the first time buyer or HAM but with the quality control that Tandy seems to posses, each unit seems like its way off the rated specs. Granted, they are generous with the specs, but the power output, freq deviation and low current draw make this seem like a kids toy rather then a good solid piece of HAM gear.

AND THE WORD HERE IS "H A M" gear. This is not a CB nor was it intended to be mod'ed either. If you want that and you like the look of the unit, then I would recommend the Sidewinder 400. It has all the features, may put out less power but can go down to 11 meter and is only $129.

I've actually just ordered a 400, so we will see what happens. As with that, I will give a full detailed report on the 400 as well.

I'm going to wait for the 400, if I like it, then the HTX-10 goes back, if not, then I might keep the HTX-10 but crank up the power.

73's, Jason

P.S. The finals actually will put out close to 40 watts as long as you put a fan on the heatsink and keep them cool. Another reason to be happy with the AMP section.

NEWSLINE 163

Newsline report number 1163, with a release date of Friday, November 26 1999 to follow in

5-4-3-2-1.

The following is a Q-S-T. Post cyclone relief efforts continue in India, the F-C-C keeps the heat up in the U-S-A
and A-P-R-S tracks down a stolen car in Canada. All this and more on Newsline report number 1163 coming your
way right now!

(Billboard Cart Here)

**

HAM RELIEF EFFORTS CONTINUE IN INDIA

Ham radio is still providing much of the communications in the aftermath of a cyclone that devastated the Indian
state of Orissa on November 11th. As reported last week, the storm wiped out all normal lines of communications
into and out of the region. Much of the communications infrastructure is still in a state of disarray making Amateur
Radio an essential part of the relief effort. Jeramy Boot, G4NJH, has more on the post cyclone ham radio lifeline:

Pkg Here

Again, those frequencies are 14 point 135 and 14 point 160 MHz on the 20 meter band. Unless you are involved in
the relief communications effort, you are asked to keep clear of these two frequencies until further notice.
(G4NJH)

THE FCC vs. WA4JTK - LETTER NUMBER FOUR

The F-C-C's has written a forth letter to Alan Strauss, WA4JTK, of Carol City Florida. This, regarding his operation
as net controller for the 14.247 D-X Group Net. Newslines Bill Burnett, KT4SB, has this follow-up report from
Miami:

The November 19th note comes in response to a letter from Strauss to the chief rules enforcer Riley Hollingsworth,
K4ZDH. A letter that apparently questioning earlier notes to him. Also asking about alleged statements credited to
the FCC regarding net operations and callsign suffix only identification.

In his latest letter to Strauss, the FCC's Riley Hollingsworth reiterates that an earlier letter should be looked at as
a warning that the FCC does not consider this matter closed. It also reminds Strauss that the FCC will continue to
monitor the DX nets operations. Also that the FCC will expect the net to share the frequency and not
commandeer it from already ongoing Amateur Radio communications.

Regarding station identification. Strauss had apparently questioned statements attributed to Hollingsworth that
were allegedly made to at least one other ham. To quote Hollingsworth's response: "our letter does not conflict
with statements made to Mr. Wilson regarding proper identification. Our letter to Wilson plainly stated that
stations must comply with Part 97 of the Commission's rules."

Hollingsworth continues by saying what he has said before. That a station identifying by only two letters of its call
sign, that is not recognized or acknowledged so that it can eventually give its call sign within the time limits of
Part 97, is in violation of the rules. He adds that as long as Part 97 is complied with, it does not matter how a
station identifies in the meantime, so long as it is not deceptive.

>From Miami, I'm Bill Burnett, KT4SB, reporting for Newsline. Ken.

Hollingsworth's letter also reminds Strauss of something else in his earlier letter. A statement that two-letter
identification, where Part 97 is violated, must not be condoned by his net group. (FCC)

**

WIDE SIGNAL GETS SECOND WARNING

And a ham who the FCC claims to be transmitting an excessively wide signal on 20 meters has received a second
warning letter from the FCC. He is identified as Glen Craft, N5RQW, of Stringer Mississippi and last March 5th the
FCC wrote him regarding what the commission says is his unusually wide signal.

Now, more than half a year later the Commission has again written to Craft regarding the same situation. In his
latest letter to Craft, FCC rules enforcer Riley Hollingsworth says that Commission monitoring continues to indicate
that N5RQW has been operating on the 20-Meter Amateur Band emitting an unusually wide

signal or one that is
over-power, or both. But that's not all. Hollingsworth says that information also indicates that Craft may have
ignored requests from other licensees operating on adjacent frequencies to correct his transmitter emissions in
accordance with good Amateur practice.

Section 97 point 303 of the Commission's rules prohibits Amateur stations from occupying more bandwidth than
necessary for the information rate and emission type being transmitted, in accordance with "good Amateur
practice.". Also, Section 97 point requires Amateur stations to use the minimum power necessary to carry out the
desired communications.

Based on these rules, Hollingsworth has cautioned Craft that failure to remedy this type of operation may
jeopardize his Amateur Radio license. (FCC)

ACCUSED CALIFORNIA HAMS RESPONDS TO FCC

Two California hams accused of interfering with a repeater says that they are not the cause of the problem.
Newslines Roy Neal, K6DUE, has more:

Newsline has heard directly from Todd Young, W6TLY and Brian Frobisher, WA6JFK. The FCC had alleged that the
two had been the source of interference to a number of Southern California repeaters.

But Young and Frobisher say that they have never been the cause of interference to the repeaters and Young
says that he not even used these repeaters in a long time. According to Young, he left the systems after disputes
arose between one of the system owners and several users. Disputes that he says he wanted no part in. Young
says that he moved his personal on the air operations to other repeaters on 220 MHz and 70 centimeters. He says
that he first became aware of the accusations against him when he heard them on Newsline and later received a
copy of the warning letter from the FCC.

Since getting the FCC warning note, Young says that he has taken to listening in on the repeaters in question. He
says that he is hearing numerous unidentified transmissions and what appear to be tape recordings played on the
449 point 920 and 445 point 680 repeaters. But says Young, these transmissions are not coming from his station
and that he has told this directly to the FCC's.

Frobisher's story is very similar. He says that he received a warning letter from Hollingsworth claiming that

evidence had been collected that he was responsible for ongoing interference on the KJ6TQ and the Crescenta
Valley Radio Club's 2 meter and 70 centimeter repeaters. Frobisher says that he told Hollingsworth that the last
time he used the KJ6TQ machine was back in 1997. He says that he left the system after hearing a young woman
allegedly told not check into a net on the machine. Frobisher says that he also heard the system being turned off
in the morning hours when the same young lady was just making a call on the repeater.

As for the Crescenta Valley Club, Frobisher says that he has used the 2 meter repeater in question sparingly, and
only recently found out about the club even had a 440 MHz system. He says that he has done nothing on the
Crescenta Valley club repeaters that could be in any way be considered malicious.

>Roy Neal, K6DUE

Both hams tell Newsline that they have been in contact with Hollingsworth to discuss the allegations. According to
the F-C-C the matter is still under review. (W6TLY, WA6JFK)

APRS TRACKS DOWN STOLEN CAR

For most of us, having a car stolen is a traumatic experience. But for one Canadian ham it became more of the
thrill of the chase. Newsline's Fred Vobbe, W8HDU, has more:

When Bill Guthrie VE6OLD of Bentley Alberta Canada woke up to find his van missing from his driveway, he did one
thing before he called the police. Bill ran down to the computer, and had a quick peek. Almost instantly, the APRS
beacon in his car told Bill's computer that his vehicle was enjoying a leisurely drive around the town of Red Deer.

Then, calmly, Bill picked up the phone and called the Royal Canadian Mounted Police. He reported the stolen van,
adding that they could recover it and catch the thieves if they sent someone the red to the Red Deer location.

They did, and the arresting officers got even more than they were looking for . It seems some young teens
needed a vehicle to haul their loot from a recent spate of break and enter robberies. Not only did the alleged
thieves get caught red handed for grand theft auto, but the stolen goodies in the van tied them to those other
crime scenes as well.

But that's not all. Obviously, the Royal Canadian Mounted Police wanted t know how the owner of a stolen vehicle
could possibly know where it was. That was an opening for VE6OLD to begin explaining the magic of Amateur
Radio's Automatic Position Reporting System. He also invited some of the officers to his house to demonstrate how
APRS works. The mounties were impressed.

>From Lima Ohio I'm Fred Vobbe, W8HDU, reporting for Newsline.

This is the second time we've heard of APRS helping retrieve a stolen vehicle. The first occurred in San Diego a
couple years ago. (N4NEQ)

INSTANT CORONATION IN THE BIG APPLE

Southern California is not the only area where last months D'wana Terry letter on repeater coordination is having
an almost immediate impact. New York City and the surrounding areas may soon find the 144 to 148 MHz repeater
subbands filled with repeaters trying to operate within 7.5 Khz of one another.

The idea to try to populate the splinter channels comes from a self professed instant coordinator calling itself the
Greater Metro New York Coordinating Committee goes forward. Headquarters in the town of Maspeth New York,
this group says that the time has come to make more repeaters available on the very crowded two meter band.

None of the F-M involved hams in the area that we have spoken with have ever heard of the Greater Metro New
York Coordinating Committee. They remind us that there has been no publicly recognized repeater coordinator
operating in the New York City for well over three years. That's when the problem plagued Tri State Repeater
Council went away.

With no radio gear on the market for hams to use on 7 point 5 Khz repeater centers, and none planned by any of
the major equipment suppliers, the Greater Metro New York Coordinating Committee is going have a fight to simply
survive. (Press release)

**

BUSINESS REPORT

A ham antenna company calls it quits and makes the announcement on a ham radio Internet Remailer. Don
Wilbanks, K-C-5-M-F-A has the information in this weeks ham radio business report. Don:

We start this weeks business report with word that yet another ham radio peripherals supplier is gone. According
to reports on the V-H-F Reflector, K-L-M Antennas has reportedly left the Amateur Radio supply business as of
October 31st.

>From the Newsline business desk in New Orleans, I'm Don Wilbanks, KC5MFA.

More with Don in future Newsline reports. (W6YX VHF Reflector)

2000 CALIFORNIA HANDI HAM RADIO CAMP

The Handi Hams Year 2000 California Radio Camp will begin on Monday, February 28th and run through Sunday,
March 5th. This at Camp Joan Mier in Malibu just North-West of the city of Los Angeles.

This very unique educational opportunity is open to all Handi-Ham members with disabilities. And thanks to a
special grant, this year campers who live West of the Rockies, or in Mexico or Canada may attend at no charge.

For more information or an application form, please contact Nancy Meydell at area code 612-520-0512 or e-mail
Nancy to nmeydel@courage.org. Be sure to include your full name, callsign if any, and postal mailing address.
(Handi Hams)

GEORGE RACE WINS THE RACE

The ARRL Great Lakes Division will have a new Director and Vice Director in January, but the Director really is not
new. He is George Race WB8BGY and his selection brings him full circle in what can best be

called an ARRL election
dicotome.

Back in 1995, Race -- the Great Lakes Vice Director since 1990 --
assumed the Director's position when former Director Al Severson, AB8P resigned. In 1997, Race was defeated for
election to the Director's post by Joe Falcone, N8TI. But after only three months into his term, Falcone resigned.
This elevated then-Vice Director Dave Coons, WT8W, to the Great Lakes Director's . Race subsequently was
named to again serve as Vice Director.

Earlier this year Race filed nomination papers seeking to regain the top job in the Division. The ARRL Committee of
Tellers on November 19th to tally votes. The count showed that George Race, WB8BGY, had once again been
elected as Great Lakes Division Director edging out both Dave Coons and Murry Scott KE8UM in a three way
contest, bringing this odyssey full circle.

Gary Johnston, KI4LA, will be the new Great Lakes Vice Director. He defeated Lawrence Solak, WD8MPV. Race
and Johnston will serve three-year terms. (ARRL)

**

INSTRUCTOR OF THE YEAR NOMINATIONS SOUGHT

Still with League news, nominations for the ARRL Instructor of the Year awards are due to section managers by
January 31 st of 2000. For more information on both these items visit the leagues website at www dot arrl dot
org. (ARRL)

US NAVY ABANDONS RADIOMAN RATING

First the United States Military decided it no longer needed to use the Morse Code. Now the Navy is about to do
away with the last vestige of its ties to traditional terrestrial two-way communications. This as it announced that
it is abandoning the rank of Radiomen.

In a not so unexpected announcement dated November 4th, the Navy said that the rating of Radioman would be
changed to Information Systems Technician, effective immediately. The announcement said that the Navy made
the change because doing so is consistent with ongoing efforts to properly man and train its personnel to handle
the changing environment of the information age.

But the Navy has made one concession to the past. It says that in keeping with the tradition of the Radioman
rating, the rating badge of electronic sparks associated with the rating is being retained

for the new Information
Systems Technician. (Hudson Loop, TWIAR, published news reports)

**

AMSAT NET WEBCHANNEL MOVE

Bruce Paige, KK5DO, reports the Houston AMSAT Net has moved to a new Internet Relay Chat channel. Bruce
says that listeners will find instructions on how to connect to the new IRC site on the KK5DO home page at
www.amsatnet.com.

Bruce also says that the live stream Real Audio server is working and in order to listen to the live stream, you must
have the Real Audio G-2 player. A free basic version of G-2 is available for download at www.real.com. (KK5DO)

**

AO-10 QSB ALARM

Jerry Brown, K5OE, also from Houston asks over the AMSAT Remailer if you have ever been stuck trying to find the
AO-10 ham satellite and hear nothing but silence? Well Jerry says that he may have a way to know when that bird
is coming into range.

K5OE says that there appears to be an alarm of sots that he has noticed that alerts him when AO-10 is emerging
from a deep fade. It manifests itself as a low-volume carrier moving across the passband from high frequency to
low frequency at about 1 Hz and about 3 d-b above the band noise. Jerry says that all he needs to do is to keep
his receiver set to the downlink of 145.904 MHz. He can then go about his other business until he hears the
telltale carrier as it travels by this frequency. Invariably, the next attempt at an uplink to AO-10 produces a
return. (K5OE via Internet Posting)

**

DX

In D-X, Asia's biggest station A61AJ will once again hit the airwaves for the C-Q World Wide C-W DX Contest
November 27th and 28th. Ali Al-Futtaim, A61AJ, has invited last year's Asian record breaking multi-multi back to
Dubai. Team members started to arrive late on November 20th. While there they plan to do some minor
maintenance on the existing antenna farm and install two new antennas for 160 meters and multiple beverage
antennas for 80 and 160 meters. Look for activity on 10 through 160 meters, including 12,17 and 30 meters on C
W, S-S-B, and R-T-T-Y before and after the contest. Q-S-L via W3UR. (W3UR)

And W0YR, K6CT and HA5JI will be active as 3A/W0YR from Monaco from November 26th to the 30th. Activity
includes the C-Q World Wide C-W Contest. Q-S-L as directed on the air. (OPDX)

And less we forget a still very hot six meter band. There, Alan Steivenart, ON4KST, reports that November 11th
was a great day for propagation in Europe. Alan is in grid square JO20. On the 11th he heard and contacted
stations in Australia, Japan and South Africa. Talk about your truly world-wide six meter D-X. (VHF Reflector)

**

CHURCH BELLS IN VK

And finally, church bells down-under may soon have ham radio and C-B operators helping them ring. Q-News
Graham Kemp, VK4BB, says a famous ham is trying to make it happen:

VK2DIK Dick Smith, is Chairman of the National Council for the
Centenary of Federation, the still 14 months or so away.

VK2DIK plans to use CB and Amateur Radio operators for a project
to ring church bells in relays right across the continent from
Perth to Sydney.

It should take about two hours.

Everyone knows Dick Smith as an energetic, dynamo-like person with a clear idea of his targets and the paths he
needs to tread, to reach them.

This story in the Orange and District Radio Clubs newsletter came from their local Observer newspaper article by a
Mr. Graham Cooke and is the first that I, personally, have heard of Dick's plan to have the citizen radio and
amateurs share the ringing of celebratory bells for the Federation Centenary.

Nevertheless, when he engages with the WIA to organize for Australia's hams to help, I trust that each of us will
do our best for this historic occasion. After all, how often have CB-ers and radio hams ever been called-upon to
work together, let alone help coordinate the pulling of ropes to belt out tunes on bronze?

>Im Graham Kemp, VK4BB, of Q-News reporting for Newsline.

For those of you who have not yet made the connection, this is the same Dick Smith who brought his famous
Australian electronics chain to the United States over a decade ago.

**

CLOSE

With thanks to the ARRL, the F-C-C, the Hudson Loop, the Radio Society of Great Britain and Australia's Q-News,
thats all from the Amateur Radio Newsline. Our web page is at www dot a r newsline dot org and our e-mail
address is newsline at a r newsline dot org.

Before we go, we have an update on Newslines financial condition. According to Andy Jarema, N6TCQ, who is our
Support Fund Administer, Newsline has only received enough financial support to keep the service going though the
middle of December. In other words, the bills from October have been paid, but now money has to be raised to
keep from loosing the phones and e-mail service in as we pass into the new millennium.

Andy says that Newsline once again existing on a week to week basis. He says that once funds dry up, he pulls
the plug and Newsline will away. Its up to you the listeners to see that this does not happen. The address is the
Newsline Support Fund, Post Office Box 660937 in Arcadia California. The zipcode is 91066. Please help keep
Newsline on the air as we pass the threshold to Y-2-K and travel well beyond.

For now, with Bill Pasternak WA6ITF at our editor's desk, I'm Ken Butler, W1NNR hoping you had a Happy
Thanksgiving -- and we thank you for listening. Newsline is copyright 1999 and all rights are reserved.

Hello Barry,

It could seem like a nice joke repeating all that "zeroes" trash that
guy posted (hopefully by mistake), but you did it on purpose, and
TWICE.
Isn't this a waste of bandwidth for us reading this newsgroup?
You could have done the same without all that garbage of zeroes,
simply writing <snip> instead of all that junk, and we would have
understood the same (and maybe liked it a little more).
The second time was a pure waste.
I hope you take this as a friendly guidance to netiqette.
cheers.

Thanks and best regards,
T-man

>
>Having spent much time in the kingdom of UK, I think it is safe to say
>running a very high-powered AM station (particularly of the splatter-box
>variety) will quickly get you well known with her magesty's post office.
Now called the RA (Radio Communications Agency).

Our boys are currently under-staffed and under-manned. You would have to
be a real nuisance or to have been reported on for causing interference
to be busted. The FM broadcast band pirates are keeping them plenty busy
in the big cities some running more power than the legal commercial
stations!
>My question to you, Phil, is I gather UK CB radios run FM from about 27.4125
>to 27.9125, is that correct?
Yes, with a rip roaring 4w.
> Which channels/frequencies are most popular
>over there?
Probably 19. Legal operation has died a death so the 19 is used by both
truckers and others mostly shouting obscenities at one another - just
like in the US!
> For instnace, here channel 19 is always busy with truckers
>(lorry drivers). With this in mind, even when the band is wide open from
>here to there, I never hear any FM stations.
You won't. In 25+ years of operating I can count number of truckers who
have got their technical act together on one hand. They may run a 100w
watt heater into some kind of stupid base loaded or short Firestick
antenna. About as good as talking to the truck up ahead.

Beams are not legally allowed so the few that are out there tend to be
used by the illegal skip shooters and DX chasers.

Of course you're not going to hear these guy's on the legal 40. We now
have a further 40 channels with the same mode and power sharing your FCC
40.
> And the stations I often talk
>to are running very basic equipment. Thoughts?
There are plenty of FM only operators who run a hundred or more watts
into a 1/2 or 5/8 wave omni and who like to shoot skip. You should hear
these on your east coast.

>MC
>
Many sideband operators either run Cobra 148's or more modern radios like Lincolns, 2830's etc. There are also a large number of jap ham ricebox users.

I went down that avenue over a 10-15 year period running the much rarer low power versions of rigs like Yaesu's FT301S and FT707S both running around 10w pep instead of the normal 10w. This allowed me to strap on a real when only low drive amp's were around.

More recently I've succumbed to collecting and using American military transceivers ie; Cubic, Harris, TWE etc. I have matching amp's as well.

They have just launched the Cobra 19 and 29 I believe but with our 80 channels of FM, only the Chinese left the mod transformer inside!!!

I have a Radio Shack TRC-225 handheld cb radio. Come with antenna. Looks Brand New! I have talked a long ways with this handheld. Also I have a Cobra CA-75 power mic. BRAND NEW IN THE BOX!!!!! Uses a 9volt battery. Really sounds great!!!

Radio Shack TRC-225- $25
Cobra Ca-75 Power Mic- $20

Together- $45 Email for questions and pictures.

depending on what kind of radio you have, and if it has had work done on it, and what your surroundings are.(car,truck,base,etc.).....But i can tell you one thing, Cobra mics are JUNK!!
...Maniac

Maybe their Power mic's but the only mic's I've known to produce some very exceptional audio quality is the 148/GrantXL mics. Like Andy said "... fidelity..." is definitely the keyword here. Every now and then you'd hear a Galaxy/Mirage/Northstar rig sounding really good with their stock mics but nothing as clear and as crisp as a 148/GrantXL mic.

Don't get me wrong. Not all Cobra/Uniden mic's are good. The stock mic's that come with the mobile/base rigs from the 142GTL / Washington on down have got some serious problems with AUDIO quality. Even the SoundTracker rigs suck. But wonders will occur when you re-pin a 148/GrantXL mic to any Cobra/Uniden rig and you'll see what I mean.

But then again, everyones got their own opinion...

137... back reading the NG!

Please, I told you. I'm not *that* type. :->

> I have a good idea of his name and location but would appreciate confirmation.
> Kindly e-mail me at this screenname.

Chip, you don't have a clue who I am. And even if you did my name would mean nothing to you, or anyone else, anyway. I really think that you should make an appointment with a mental health professional. Your behaviour on the rec.radio.amateur.antenna group is not in keeping with recent socially-acceptable norms - even by liberal Usenet standards. Take a lead from me and post some useful information that others can benefit from instead of your threats of lawsuits or your scathing rebuttals to postings that only you misinterpreted.

And quite possibly the most remarkable thing is that you've never asked me who I am!
Now get out of my face before I have to bitch-slap you with my keyboard again.

MC 10kW just got down....

Yo Mike, go easy on Bill. He's not wrong and nor are you. There is another way of achieving a noise-cancelling function. Dynamic microphones exhibit what's called "proximity effect". This means that when you shove your face into the microphone and talk it will wildly exaggerate the base response. Stand up comics make great use of this! You can design a single-element microphone that takes advantage of this proximity effect. However, it has the appropriate tone-shaping to make the output sound un-bassy. Ceramic microphones don't normally succumb to the proximity effect and are in essense somewhat noise cancelling already.

MC

You are correct sir. The underside where the coax shield comes out
should touch the metal of the bumper. Firestik has several different
coax terminators for this purpose.

>
>

Whew! Sorry if you work for Motorla and I ruffled your feathers! The fact remains, single band equipment will outperform rigs designed to cover 1.6 to 30 MHz--which are, by necessity, a compromise.

You mentioned Uniden. I was thinking specifically about the RCI-2950/2970, etc. I've run them side-by-side with general coverage big-name radios costing nearly ten times as much. There's no getting around it. The RCI receivers are H-O-T!

Perhaps you and I can agree to disagree on this subject. Want to move on to my next point--trying to tune up and down through a band looking for random contacts? Or have you ever used one of the ITU-style radios? If not, we probably should skip this discussion.

A COMPARISON:
A ship's chronometer is a special kind of clock. It isn't all that accurate. Its value is that it gains and looses time at a predictable rate. A daily correction factor is recorded in the log, based on temperature, barometer readings, and humidity for the past 24 hours. Thus, the face of the clock does not display the correct time, but the correct time can be determined by using the correction factor. You would not want something like this as a wrist watch. But it made navigation more accurate for centuries of seafarers.

By the same token, the Motorola SSB unit is great for what it is designed to do. While it is an item of curiosity to CBers, it would never make the "most popular radio" list on 11 Meters.

Greetings!

A means to open the exhaust valves to lower vacuum inside the motor, slowing down the intake of fuel from the intake manifold. Leans out the mixture and prevents blow-by when manifold vacuum can litterally cause valve seat and seals to fail. It recycles exhaust fumes back into the cylinders - also cooling off the motor.

When the valves are shut, little combustion takes place, the fuel is too lean to burn easily. Since this doesn't generate power, the engine simply squeezes air in the cylinders and forces the engine to work against the torque the drive shaft places on it.

It's used for decelleration to slow down the mass of the truck without smoking the brakes trying to slow down or stop.

While Dancing with the Mouse on Mon, 29 Nov 1999 14:11:22 -0600, the Modem interrupted with an MNI from ""Kevin Muenzler WB5RUE" <wb5rue@stic.net>", and the MotherBoard buffered this to Video RAM:

MotherBoard buffered this to Video RAM:

:+> I have a mag-mount with stainless whip. 2 questions:

Ok...

:+> 1) does SWR change if antenna is transferred between vehicles?

Yes, it can. If you use a different style of vehicle [e.g.- Truck
versus Geo Metro, quite a difference in amount of metal] and the
location where you place it will have an effect on SWR.

Always a good idea to check it after you've got the antenna on the
other vehicle to make sure it's ok.

You only need to do it once, to make sure it's set. Then once you know
the match between the two vehicles and their respective locations, you
don't need to "re-check" all the time. Just put the antenna back in
the same spot on each vehicle and you're fine.

:+> 2) for a given vehicle/antenna combo, does SWR change if a different
:+> radio is
:+> used?

This is a tricky one to answer, in a word no.

At least it shouldn't change.

I do know of some radios, when they've been peaked and tweaked, they
can change the meter SWR because the output impedance is different and
it shows up on the meter.

As long as the SWR is below 2 you're fine.

Greetings!

Wise words!

Good points.

If the gentleman is looking for recommendations, I suggest Uniden pre-1994 stock.

Especially if it's in good shape.

The ones made in the Philippines are the ones that have the better boards.

However, some older radios can be found at Garage Sales, they may not work, but usually it's a simple TX capacitor or Transistor in the TX section that made them throw it in the bargain bin in the first place.

A little fix up and you're with a good radio again.

If you don't want to do that, another good source for radios, is from a CB Shop locally around you. A lot of times, people upgrade to another radio and trade in their older one. This is not the cheapest route, but at least you can ask to see if the Shops' "tech" has gone over the radio and given their "Stamp of approval" to re-sell it.

CB's are like old friends, many people take care of their equipment, and don't really want to part with it. [I know I'm that way...it shows!]

When they do, they are parting with an old friend. They may need the money, but they also want to make sure it "Has a good home".

A lot of it has to deal with how the person conducts themselves over the air. You can run into a "burn" or two dealing with used equipment. So paying attention to the persons actions and conduct usually gives you a strong hint as to how they treat their equipment.

While Dancing with the Mouse on 29 Nov 1999 11:50:00 GMT, the Modem interrupted with an MNI from "redhicks@aol.comnojunk (Debbie Hicks)", and the MotherBoard buffered this to Video RAM:

:+> >Planning on buying a CB when I get my new truck soon (can't drive a 4x4
:+> >without one) but I was wondering about the quality of new radios
:+> >compared to older used ones. It seems like everything these days is
:+> >made cheaply, to be replaced in a couple of years (hope my new truck
:+> >won't be like that :-) Any thoughts?
:+> >

:+> Well like everything else in ten years it too will be old and the best made
:+> compared to the new stuff.
:+>
:+> A radio, regardless of what year it was made, will last a good long while. If
:+> it is taken care of properly. If abused then you may have to replace it in a
:+> couple of years.
:+> Just like your 4x4. Take care of it and it will last you a while.
:+>
:+> How did you like all that talk around.
:+>
:+> But really if you can find a good radio used then go for it. Depends on how
:+> much you want to spend. Beware of the radio's that may have been hacked up.
:+> Spend wisely and have a good time.
:+>
:+>

RED wire is + positive 12v

Black is - minus or ground

green goes to mike jack Key radio line - disconnect the key line from the mike jack and put the green wire there

yellow wire is for the key radio line into the radio that you disconnected from the mike jack

white wire is the audio wire connected to the mike jack

orange wire(s) are a disable wired to a SPST switch.

about $35 to $65 is all your going to get out of a 5 tone RB
